ABSTRACT**LOCK**

A lock to ensure smooth operation of the deadbolt has a drive lever (30) pivotally engaged with the deadbolt (21) and a disk (40) rotatably mounted on the deadbolt (21) and engaged with a side face of the drive lever (30). With the abutment of the drive lever (30) against an inner face of a frame of the lock, the deadbolt (21) is able to move evenly into the frame when the lock is changed from a locked condition to an unlocked condition.
