CLAIMS:

1. An experience system of an amusement park, the experience system comprising:

a memory storing instructions;

a processor configured to execute the instructions; and

a prop comprising a sensor configured to detect a user interaction with the prop, wherein the prop is configured to transmit feedback to the processor in response to detecting the user interaction via the sensor;

wherein the instructions causes the processor to:

receive a user input from a computing device of a guest, the user input indicative of starting a quest-based narrative, wherein the quest-based narrative comprises a plurality of sets of information associated with a storyline;

associate an identifier associated with the computing device with a virtual queue on the experience system associated with a narrative endpoint of the amusement park based on the user input, the narrative endpoint is a reachable endpoint by completing the quest-based narrative;

select a first set of information from the plurality of sets of information based on a determined parameter, wherein the first set of information is associated with a first requested task corresponding to the prop;

output the first set of information to the computing device;

receive the feedback from the prop, wherein the feedback is indicative of the user interaction with the prop, and the user interaction corresponds to the identifier associated with the computing device;

determine a completion of the first requested task based on the feedback received from the prop;

select a second set of information from the plurality of sets of information in response to determining the completion of the first requested task, wherein the second set of information is associated with a second requested task; and

output the second set of information to the computing device.

2. The experience system of claim 1, wherein the processor is configured to execute the instructions to cause the processor to:

determine a wait time associated with the virtual queue upon determining the completion of the first requested task based on the feedback received from the prop;

select the second set of information from the plurality of sets of information based on an estimated time to complete the second requested task associated with the second set of

information and the wait time associated with the virtual queue.

3. The experience system of claim 1, wherein the second requested task is associated with access to the narrative endpoint.

4. The experience system of claim 1, wherein the processor is configured to execute the instructions to cause the processor to:

receive additional feedback after outputting the second set of information to the computing device, wherein the additional feedback is indicative of a completed task;

determine the completed task does not correspond with the second requested task; and

output a message to the computing device in response to determining the completed task does not correspond with the second requested task, the message indicative of the second requested task not being successfully completed in response to determining the completed task does not correspond with the second requested task.

5. The experience system of claim 1, wherein the processor is configured to execute the instructions to cause the processor to transmit additional feedback to the narrative endpoint, wherein the additional feedback comprises information associated with the completion of the first requested task and the identifier associated with the computing device.

6. The experience system of claim 1, wherein the narrative endpoint comprises a limited capacity attraction, a discount, an access to a restricted area, a special edition of an attraction, a souvenir, a voucher, or any combination thereof, of the amusement park.

7. The experience system of claim 1, wherein the determined parameter is associated with a wait time of the virtual queue, a time of day, a weather condition, a population density of a region of the amusement park, a number of users associated with the computing device, a location of the computing device, an experience level of a user associated with the computing device, a status of other computing devices participating in other quest-based narratives, or any combination thereof.

8. An amusement park system, comprising:

at least one interactive element, wherein the at least one interactive element is configured to provide feedback indicative of a completed task;

an experience system configured to:

receive an input transmitted from a computing device of a user at an initial time, wherein the input is indicative of starting a quest-based narrative associated with

a storyline;

associate an identifier associated with a computer device of the user with a virtual queue on the experience system associated with an endpoint of the quest-based narrative;

determine a desired time for the user to arrive at a location of the endpoint of the quest-based narrative, wherein the desired time is based on an availability at the endpoint;

select a first task to be completed by the user based on a first estimated time to complete the first task, the initial time at which the input was received from the computing device, and the desired time for the user to arrive at the location of the endpoint;

output the first task to the computing device;

receive the feedback indicative of the completed task from the at least one interactive element at an updated time;

determine the completed task corresponds to the first task based on the feedback;

select a second task to be completed by the user in response to determining the completed task corresponds to the first task and based on a second estimated time to complete the second task, the updated time at which the feedback indicative of the completed task was received from the at least one interactive element, and the desired time for the user to arrive at the location of the endpoint; and

output the second task to the computing device.

9. The amusement park system of claim 8, wherein the experience system is configured to:

receive additional feedback indicative of completion of the second task at an additional updated time;

determine a difference between the additional updated time and the desired time is below a threshold; and

output, to the computing device, a message indicative of enabled access to the endpoint of the quest-based narrative in response to determining that the difference between the additional updated time and the desired time is below the threshold.

10. The amusement park system of claim 8, wherein the experience system is configured to:

receive additional feedback indicative of completion of the second task at an additional updated time;

adjust the desired time to an updated desired time for the user to arrive at the location

of the endpoint after receiving the additional feedback indicative of the completion of the second task; and

select a third task based on a third estimated time to complete the third task, the additional updated time at which the additional feedback indicative of the completion of the second task was received, and the updated desired time.

11. The amusement park system of claim 10, wherein the experience system is configured to receive the additional feedback from the computing device of the user.

12. The amusement park system of claim 8, wherein the at least one interactive element comprises a reader configured to read an identifier associated with the user and to provide the feedback indicative of the completed task to the experience system upon reading the identifier associated with the user.

13. The amusement park system of claim 12, wherein the at least one interactive element comprises a show effect communicatively coupled to the reader, wherein the reader is configured to transmit, to the show effect, additional feedback indicative of an interaction upon reading the identifier associated with the user, and wherein the show effect is configured to activate upon receiving the additional feedback indicative of the interaction.

14. The amusement park system of claim 8, wherein the at least one interactive element comprises an identifier that is readable to the computing device, wherein the computing device is configured to transmit additional feedback indicative of the completed task in response to reading the identifier of the at least one interactive element, and wherein the experience system is configured to receive the additional feedback indicative of the completed task from the computing device.

15. The amusement park system of claim 8, wherein the input transmitted from the computing device comprises a selection of the endpoint, and wherein the experience system is configured to select the first task and the second task based on the endpoint.

16. The amusement park system of claim 8, wherein the experience system is configured to:

determine a location of the computing device of the user; and

determine the first estimated time to complete the first task, the second estimated time to complete the second task, or both based on the location of the computing device.

17. A controller for an amusement park system, the controller comprising a tangible, non-

transitory, computer-readable medium having computer-executable instructions stored thereon that, when executed, are configured to cause one or more processors to:

receive a user input from a computing device of a guest group of the amusement park system, wherein the user input is indicative of starting a quest-based narrative, and wherein the quest-based narrative comprises a plurality of sets of information associated with a storyline;

associate an identifier associated with the computer device of the guest group with a virtual queue on the amusement park system associated with a narrative endpoint of the amusement park, the narrative endpoint is a reachable endpoint by completing the quest-based narrative;

determine a wait time associated with the virtual queue for accessing the narrative endpoint;

select a first set of information from the plurality of sets of information based on a first estimated time to complete a first task associated with the first set of information and the wait time associated with the virtual queue;

output the first set of information to the computing device upon selecting the first set of information;

receive feedback indicative of completion of the first task associated with the first set of information;

determine an updated wait time in response to receiving the feedback indicative of the completion of the first task;

in response to determining the updated wait time is above a threshold, select a second set of information from the plurality of sets of information based on a second estimated time to complete a second task associated with the second set of information and the updated wait time associated with the virtual queue;

output the second set of information to the computing device upon selecting the second set of information; and

in response to determining the updated wait time is below the threshold, output a message indicative of enabled access of the narrative endpoint to the computing device.

18. The controller of claim 17, wherein the computer-executable instructions, when executed, are configured to cause the one or more processors to:

determine an interruption of the quest-based narrative;

determine if the interruption is indicative of ending progress of the quest-based narrative; and

output a message indicative of enabled access of an alternative narrative endpoint to the computing device based on a progression of the quest-based narrative in response to determining

the interruption is indicative of ending the progress of the quest-based narrative.

19. The controller of claim 17, wherein the computer-executable instructions, when executed, are configured to cause the one or more processors to:

determine an interruption of the quest-based narrative;

determine if the interruption is indicative of ending progress of the quest-based narrative;

save the progress of the quest-based narrative in response to determining the interruption is not indicative of ending the progress of the quest-based narrative;

receive feedback indicative of a continuation of the quest-based narrative; and

resume the quest-based narrative in response to receiving the feedback indicative of the continuation of the quest-based narrative.

20. The controller of claim 19, wherein the interruption comprises a manual pause of the quest-based narrative, an inactivity of the guest group, a weather condition, an unavailability of an attraction of the amusement park system, or any combination thereof.
