(54) Title: HANDHELD TRADING SYSTEM INTERFACE

(57) Abstract: A computer implemented method for interacting with a user of a trading computer includes forming a number of ticker pages, simultaneously displaying ticker page selection elements, and displaying one of the ticker pages based on an input identifying one of the page selection elements. Each ticker page includes trade order information for a negotiable item (such as a stock or other equity) and each ticker page selection element is associated with one of the ticker pages. A trading computer includes a screen that can operate as both an output display and an input digitizer and a processor coupled to the screen and to a memory. The memory includes instructions for causing the processor to form and display ticker pages on the screen. Each ticker page includes trade order information for a different negotiable item. A currently displayed ticker page may be determined based on a selection of a ticker page selection elements. The ticker page selection elements may be rendered as page tabs that are displayed at a different output display location. The computer memory also may include additional instructions for implementing other methods of the invention.
