

Abstract

The present invention provides a compound for forming a conjugate with an oligonucleotide, the compound having a structure as shown in Formula (I). The present disclosure also provides a corresponding conjugate, and the use of said conjugate in the preparation of a medicament for preventing and/or treating related diseases. The conjugate of the present disclosure has the advantages of inexpensive raw materials, simple synthesis, and easy process development, while also having good oligonucleotide synthesis efficiency and in vivo biological activity in small animals.
