

ANTI-ENTEROVIRUS 71 THIADIAZOLIDINE DERIVATIVE

FIELD OF TECHNOLOGY

[0001] The present invention relates to a novel anti-enterovirus 71 (EV71) 1,2,5-thiadiazolidine-1,1-dioxide derivative or a pharmaceutically-acceptable salt(s) thereof, specifically a compound(s) represented by Formula (II) or a pharmaceutically-acceptable salt(s) thereof.

BACKGROUND

- [0002] The enterovirus 71 is a member of small RNA virus family and one of the most common etiologies of hand-foot-mouth disease. It can also cause various diseases related to nervous system such as herpes pharyngitis, aseptic meningitis, encephalitis, and poliomyelitis-like paralysis and is possibly accompanied with severe central nervous system complications or neuritic pulmonary edema.
- [0003] The hand-foot-mouth disease features strong epidemic intensity, strong infectivity, and complex transmission route. There is no specific anti-enterovirus 71 medicine yet.
- [0004] Although the existing technologies such as the patents of US20030087936, US6706739, US20040116476, US20050267164, and US20070049623 have disclosed a series of structures, for example the structures represented by Formula (B-I), it still needs in urgency to develop a novel compound with better activity that is more beneficial to make medicine.

SUMMARY

[0005] The present invention provides a compound represented by Formula (II) or a pharmaceutically-acceptable salt(s) thereof;

Wherein:

[0006] R₃ is any selected from 5-membered heterocycles, C₆₋₁₂ aryl groups, C₆₋₁₂ aralkyl groups, C₅₋₁₂ heteroaromatic rings and C₅₋₁₂ heteroaryl groups substituted with R₀₁;

[0007] L₂ is independently selected respectively from

[0008] m₁ and m₂ are independently selected respectively from 0, 1, 2, 3, 4, 5 or 6;

[0009] X₁ and X₂ are independently selected respectively from single bond, -C(R_{d1})(R_{d2})-, -C(=O)N(R_{d3})-, -N(R_{d4})-, -C(=NR_{d5})-, -S(=O)₂N(R_{d6})-, -S(=O)N(R_{d7})-, -O-, -S-, -C(=O)O-, -C(=O)-, -C(=S)-, -S(=O)- or -S(=O)₂;

[0010] R₄ is selected from 5~14-membered cyclic hydrocarbyl or heterocycloalkyl groups;

- [0011] R_{d1} and R_{d2} are independently selected respectively from H, F, Cl, Br, I, CN, OH, SH, NH_2 , CHO, COOH or any selected from C_{1-10} alkyl or heteroalkyl groups and C_{3-10} cyclic hydrocarbonyl or heterocycloalkyl groups substituted with R_{01} , C_{1-10} alkyl or heteroalkyl groups substituted with C_{3-10} hydrocarbonyl or heterocycloalkyl groups;
- [0012] R_{01} is selected from F, Cl, Br, I, CN, OH, SH, NH_2 , CHO, COOH and R_{02} ;
- [0013] R_{02} is selected from C_{1-10} alkyl groups, C_{1-10} alkylamino groups, N,N-di(C_{1-10} alkyl) amino groups, C_{1-10} alkoxy groups, C_{1-10} alkanoyl groups, C_{1-10} alkoxycarbonyl groups, C_{1-10} alkylsulfonyl groups, C_{1-10} alkylsulfinyl groups, C_{3-10} cycloalkyl groups, C_{3-10} cycloalkylamino groups, C_{3-10} heterocyclic alkyl amino groups, C_{3-10} cycloalkoxy groups, C_{3-10} cycloalkyl acyl groups, C_{3-10} cycloalkoxy-carbonyl groups, C_{3-10} cycloalkylsulfonyl groups and C_{3-10} cycloalkylsulfinyl groups;
- [0014] The "hetero" denotes a hetero atom or hetero atom radical selected from $-C(=O)N(R_{d3})-$, $-N(R_{d4})-$, $-C(=NR_{d5})-$, $-S(=O)_2N(R_{d6})-$, $-S(=O)N(R_{d7})-$, $-O-$, $-S-$, $=O$, $=S$, $-C(=O)O-$, $-C(=O)-$, $-C(=S)-$, $-S(=O)-$ and/or $-S(=O)_2-$;
- [0015] R_{d3-d7} is independently selected respectively from H and R_{03} ;
- [0016] R_{03} is selected from C_{1-10} alkyl groups, C_{1-10} alkanoyl groups, C_{1-10} alkoxycarbonyl groups, C_{1-10} alkylsulfonyl groups, C_{1-10} alkylsulfinyl groups, C_{3-10} cycloalkyl groups, C_{3-10} cycloalkyl acyl groups, C_{3-10} cycloalkoxy-carbonyl groups, C_{3-10} cycloalkylsulfonyl groups and C_{3-10} cycloalkylsulfinyl groups.
- [0017] R_{02} and R_{03} are optionally substituted with R_{001} ;
- [0018] R_{001} is selected from F, Cl, Br, I, CN, OH, $N(CH_3)_2$, $NH(CH_3)$, NH_2 , CHO, COOH, trifluoromethyl group, aminomethyl group, hydroxymethyl group, methyl group, methoxy group, formyl group, methoxycarbonyl group, methylsulfonyl group and methylsulfinyl group;
- [0019] The number of R_{01} , R_{001} and hetero atom or hetero atom radical is independently selected respectively from 0, 1, 2 or 3;
- [0020] Optionally, R_{d1} and R_{d2} interconnects to a 3 or 4-membered carbocyclic or heterocyclic ring.
- [0021] In some schemes according to the present invention, R_3 is any selected from substituted 5 ~ 6 membered aryl and substituted heteroaryl group.
- [0022] In some schemes according to the present invention, R_3 is any selected from pyridyl group, phenyl group, furanyl group, pyrazolyl group, pyrrolyl group, thiazolyl group, pyridazinyl group, pyrimidinyl group, and thienyl group substituted with R_{01} and the definition of R_{01} is as above and the number of R_{01} is selected from 0, 1, 2 or 3.
- [0023] In some schemes according to the present invention, R_{01} is selected from F, Cl, Br, I, CN, OH, SH, NH_2 , CHO,

- [0024] In some schemes according to the present invention, R_3 is selected from the following:

[0025] In some schemes according to the present invention, L_2 is selected from $\text{---X}_1\text{---}(\text{---})_{m_3}\text{---X}_2\text{---}$ and m_3 is 0, 1 or 2 and other variables are defined as above.

[0026] In some schemes according to the present invention, X_1 and X_2 are independently selected respectively from

[0027] In some schemes according to the present invention, L_2 is selected from the following:

[0028] In some schemes according to the present invention, R_4 is selected from the following:

[0029] T_{4-7} is independently selected respectively from N or C(R_i).

[0030] D_{1-3} , D_5 and D_6 are independently selected respectively from single bond, $-\text{C}(\text{R}_{d1})(\text{R}_{d2})-$, $-\text{C}(=\text{O})\text{N}(\text{R}_{d3})-$, $-\text{N}(\text{R}_{d4})-$, $-\text{C}(=\text{NR}_{d5})-$, $-\text{S}(=\text{O})_2\text{N}(\text{R}_{d6})-$, $-\text{S}(=\text{O})\text{N}(\text{R}_{d7})-$, $-\text{O}-$, $-\text{S}-$, $-\text{C}(=\text{O})\text{O}-$, $-\text{C}(=\text{O})-$, $-\text{C}(=\text{S})-$, $-\text{S}(=\text{O})-$ or $-\text{S}(=\text{O})_2-$.

[0031] n_2 is selected from 0, 1, 2 or 3,

[0032] n_3 is selected from 0, 1 or 2,

[0033] R_5 , R_6 , R_7 , R_i , R_{d1} and R_{d2} are independently selected respectively from H, F, Cl, Br, I, CN, OH, SH, NH_2 , CHO and COOH or any selected from C_{1-10} alkyl or heteroalkyl groups and C_{3-10} cyclic hydrocarbonyl or heterocycloalkyl groups substituted with R_{01} , C_{1-10} alkyl or heteroalkyl groups substituted with C_{3-10} hydrocarbonyl or heterocycloalkyl groups. Other variables are defined as in claim 1.

[0034] In some schemes according to the present invention, R_4 is selected from the following:

[0035] X_3 is selected from F, Cl, Br, I, CN, OH, SH, NH_2 , CHO, COOH or any selected from C_{1-10} alkyl or heteroalkyl groups and C_{3-10} cyclic hydrocarbonyl or heterocycloalkyl groups substituted with R_{01} , C_{1-10} alkyl or heteroalkyl groups substituted with C_{3-10} hydrocarbonyl or heterocycloalkyl groups.

[0036] In some schemes according to the present invention, R_{5-7} is independently selected respectively from the following:

[0037] T_{1-3} is independently selected respectively from N or C(R_i);

[0038] D_4 is selected from $-C(R_{d1})(R_{d2})-$, $-C(=O)N(R_{d3})-$, $-N(R_{d4})-$, $-C(=NR_{d5})-$, $-S(=O)_2N(R_{d6})-$, $-S(=O)N(R_{d7})-$, $-O-$, $-S-$, $-C(=O)O-$, $-C(=O)-$, $-C(=S)-$, $-S(=O)-$ or $-S(=O)_2-$;

[0039] R_8 , R_9 and R_i are independently selected respectively from H, F, Cl, Br, I, CN, OH, SH, NH_2 , CHO, COOH or any selected from C_{1-10} alkyl or heteroalkyl groups and C_{3-10} cyclic hydrocarbonyl or heterocycloalkyl groups substituted with R_{01} , C_{1-10} alkyl or heteroalkyl groups substituted with C_{3-10} hydrocarbonyl or heterocycloalkyl groups;

[0040] R_{10} is selected from F, Cl, Br, I, CN, OH, SH, NH_2 , CHO, COOH or any selected from C_{1-10} alkyl or heteroalkyl groups and C_{3-10} cyclic hydrocarbonyl or heterocycloalkyl groups substituted with R_{01} , C_{1-10} alkyl or heteroalkyl groups substituted with C_{3-10} hydrocarbonyl or heterocycloalkyl groups.

[0041] In some schemes according to the present invention, R_{5-9} , R_{01} and R_i are independently selected respectively from the following:

methyl, ethyl, propyl, methoxy, ethoxy, propoxy and

[0042] In some schemes according to the present invention, R_4 is selected from the following:

[0043] Specifically, the present invention selects it from the following:

Relevant definitions:

[0044] Unless indicated otherwise, the following terms and phrases used here are intended to have the following meanings. Any specific term or phrase without specific definition should not be regarded as uncertain or indistinctive but should be understood as its common meaning. Any trade name appearing in the present invention denotes the corresponding product it refers to or its active ingredient.

[0045] C₁₋₁₂ is selected from C₁, C₂, C₃, C₄, C₅, C₆, C₇, C₈, C₉, C₁₀, C₁₁ and C₁₂; C₃₋₁₂ is selected from C₃, C₄, C₅, C₆, C₇, C₈, C₉, C₁₀, C₁₁ and C₁₂.

[0046] C₁₋₁₂ alkyl or heteroalkyl group, C₃₋₁₂ cyclic or heterocycloalkyl group and C₁₋₁₂ alkyl or heteroalkyl group substituted with C₃₋₁₂ cycloalkyl or heterocycloalkyl group include but not limited to:

[0047] C₁₋₁₂ alkyl groups, C₁₋₁₂ alkylamino groups, N,N-di(C₁₋₁₂ alkyl) amino groups, C₁₋₁₂ alkoxy groups, C₁₋₁₂ alkanoyl groups, C₁₋₁₂ alkoxycarbonyl groups, C₁₋₁₂ alkylsulfonyl groups, C₁₋₁₂ alkylsulfinyl groups, C₃₋₁₂ cycloalkyl groups, C₃₋₁₂ cycloalkylamino groups, C₃₋₁₂ heterocyclic alkyl amino groups, C₃₋₁₂ cycloalkoxy groups, C₃₋₁₂ cycloalkyl acyl groups, C₃₋₁₂ cycloalkoxy-carbonyl groups, C₃₋₁₂ cycloalkylsulfonyl groups and C₃₋₁₂ cycloalkylsulfinyl groups, 5 ~ 12 membered aryl or heteroaryl groups and 5 ~ 12 membered aralkyl or heteroaralkyl groups;

[0048] methyl group, ethyl group, n-propyl group, isopropyl group, -CH₂C(CH₃)₂(OH), cyclopropyl group, cyclobutyl group, propyl methylene, cyclopropylmethyl group, benzyl group, trifluoromethyl group, aminomethyl group, hydroxymethyl group, methoxy group, formyl group, methoxycarbonyl group, methylsulfonyl group, methylsulfinyl group, ethoxy group, acetyl group, ethanesulfonyl group, ethoxycarbonyl group, dimethyl amino group, diethylamino group, dimethylamino-carbonyl group and diethyl-aminocarbonyl group;

- [0049] The term "pharmaceutically-acceptable" used here refers to the compound(s), material(s), composition(s) and/or dosage form(s) that is suitable within the scope of reliable medical judgments to be used in contact with the human and animal tissues, without posing excessive toxicity, irritation, allergic reactions or other issues or complications and with reasonable benefit / risk ratio.
- [0050] The term "pharmaceutically-acceptable salt(s)" refers to the salt(s) of the compound(s) according to the present invention that is prepared from the compound(s) with specific substituting group developed according to the present invention and relatively-nontoxic acid or base. If any compound according to the present invention contains a relatively-acidic functional group, an adequate amount of base can be added in its pure solution or appropriate inert solvent to contact with such compound in neutral form to yield a salt of base addition. The pharmaceutically-acceptable base(s) includes the salts of sodium, potassium, calcium, ammonia, organic ammonium or magnesium or similar salts. If any compound according to the present invention contains a relatively-basic functional group, an adequate amount of acid can be added in its pure solution or appropriate inert solvent to contact with such compound in neutral form to yield a salt of acid addition. The examples of the pharmaceutically-acceptable salt(s) include the inorganic acid salt(s) that includes hydrochloric acid, hydrobromic acid, nitric acid, carbonate, bicarbonate, phosphate, hydrogen phosphate, phosphate, dihydrogen phosphate, sulfate, bisulfate, hydroiodic, phosphorous, etc, and the organic acid salt(s) that includes acetic acid, propionic acid, isobutyric acid, maleic acid, propionic acid, benzoic acid, succinic acid, suberic acid, fumaric acid, lactic acid, mandelic acid, phthalic acid, benzenesulfonic acid, p-toluene sulfonic acid, citric acid, tartaric acid, methanesulfonic acid, etc, and also the salt(s) of amino acid(s) (such as arginine) as well as the salt(s) of organic acid(s) such as glucuronic acid (see Berge et al., "Pharmaceutical Salts", Journal of Pharmaceutical Science 66:1-19(1977)). Some specific compounds according to the present invention contain basic and acidic functional group(s) and hence can be transformed into any salt of basic or acid addition.
- [0051] Preferentially, the salt contacts with base or acid in a conventional way before the parent compounds are separated to regenerate the neutral form of compounds. The differences between the compounds in parent form and in the form of various salts lie in some physical properties, e.g. the different solubility in polar solvent.
- [0052] The "pharmaceutically-acceptable salt(s)" used here is the derivative(s) of the compound according to the present invention, wherein said parent compound(s) is modified by the means of salification with acid or salification with base. The examples of pharmaceutically-acceptable salt(s) include but are not limited to inorganic acid salt(s) or organic acid salt of basic group such as amine and the alkali metal or organic salt(s) of acid group such as carboxylic acid, etc. The pharmaceutically-acceptable salt(s) includes the conventional non-toxic salt(s) or the quaternary ammonium salts of parent compound, e.g. the salt(s) produced from non-toxic inorganic acid organic acid. The conventional non-toxic salt(s) includes but is not limited to those salts derived from inorganic acid and organic acid that is selected from 2-acetoxybenzoic acid, 2-hydroxyethane sulfonic, acetic, ascorbic, benzenesulfonic, benzoic, bicarbonate radical, carbonate, citric acid, edetic acid, ethane disulfonic acid, ethanesulfonic acid, fumaric acid, glucoheptonic acid, gluconic acid, glutamic acid, glycolic acid, hydrobromic acid, hydrochloric acid, hydroiodide acid, hydroxyl, hydroxynaphthoic acid, isethionic acid, lactic

acid, lactobionic acid, dodecyl sulfonic acid, maleic acid, malic acid, mandelic acid, methane sulfonic acid, nitric acid, oxalic acid, pamoic acid, pantothenic acid, phenylacetic acid, phosphoric acid, poly-galacturonic acid, propionic acid, salicylic acid, stearic acid, sub-acetic acid, succinic acid, sulfamic acid, sulfanilic acid, sulfuric acid, tannin, tartaric acid and p-toluenesulfonic acid.

- [0053] The pharmaceutically-acceptable salt according to the present invention can be synthesized with the conventional chemical method(s) from the parent compounds containing acidic or basic group(s). Generally, the methods of preparing such salt are as follows: in water or organic solvent or in a mixture of them, these compounds in the form of free acid or base react with appropriate base or acid in stoichiometry. Usually, it is preferable to select a non-aqueous media such as ether, ethyl acetate, ethanol, isopropanol, or acetonitrile.
- [0054] In addition to the form of salt, the compound(s) provided according to the present invention also include the form of prodrug. The prodrug of a compound(s) described here can easily undergo chemical change under physiological conditions so as to transform to the compound(s) according to the present invention. In addition, the prodrug can be transformed into the compound(s) according to the present invention via a chemical or biochemical method in an in-vivo environment.
- [0055] Some compounds according to the present invention can exist in the form of non-solvation or solvation, including the form of hydrate. In general, the form of solvation and the form of non-solvation are equivalent to each other and both covered within the scope of the present invention. Some compounds according to the present invention can exist in the form of polycrystal or amorphism.
- [0056] Some compounds according to the present invention can contain asymmetric carbon atoms (optical center) or double bond. The raceme, diastereoisomer, geometric isomer and single isomer are all covered within the scope of the present invention.
- [0057] The graphic method for the pure compounds of racemate, ambiscalemic and scalemic or antipode is sourced from Maehr, J. Chem. Ed. 1985, 62:114-120. 1985, 62: 114-120. Unless indicated otherwise, the wedge key and the dotted-line key are used to indicate the absolute configuration of a stereocenter. If said compounds here contain olefinic double bond or other asymmetric geometry center, they should include the geometric isomers of *E* and *Z*. Similarly, all the tautomeric forms shall be covered within the scope of the present invention.
- [0058] The compound(s) according to the present invention can present in the form of specific geometric isomer or stereoisomer. All these compounds proposed by the present invention, including the *cis*- and *trans*- isomers, (-)- and (+) - enantiomer, (*R*)- and (*S*)- enantiomer, diastereoisomer, (*D*)- isomer, (*L*)- isomer and their racemic mixtures and other mixtures, e.g. the mixture enriched in enantiomer or non-enantiomer, are all covered within the scope of the present invention. The substituting group such as alkyl may contain other asymmetric atoms. All these isomers and their mixtures are covered within the scope of the present invention.
- [0059] The chiral synthesis or chiral reagent or other routine techniques can be used to prepare the (*R*)- and (*S*)-isomers as well as *D* and *L* isomers with optical activity. If an enantiomer of some compound according to the present invention is desired, it can be prepared through asymmetric synthesis or the derivatization effect of chiral auxiliary reagent, where the prepared non-enantiomer mixture is separated and the auxiliary group is split to provide the necessary enantiomer. Or, if a molecule contains basic function group (e.g. amino) or acid functional group (e.g. carboxyl), it can form the salt of non-enantiomer with appropriate acid or base with optical activity before the non-enantiomer is separated via the fractional crystallization process or chromatography generally known by those skilled in the art and then recovered to obtain the pure enantiomer. In addition, the separation between enantiomer and non-enantiomer is usually finished via chromatography, which utilizes chiral stationary phase and necessarily combines with chemical derivatization method (e.g. an amine is used to produce carbamate).
- [0060] The compound(s) according to the present invention may contain a non-natural ratio of isotope of one or more atoms constituting the compound. e.g., the radioactive isotope labeled compound such as tritium (³H), I-125 (¹²⁵I) or C-14(¹⁴C) can be used. All the transformations of the isotope composition of a compound according to the

present invention shall, regardless of being radioactive or not, be covered within the scope of the present invention.

- [0061] The term "pharmaceutically-acceptable carrier" refers to any preparation or carrier medium that can deliver an effective dose of active substance according to the present invention, not interfere with the biological activity of the active substance and pose no toxic and side effect to host or patient. The representative carriers include water, oil, vegetable and mineral, paste, lotion base and ointment base, etc. These bases include suspending agent, tackifier and transdermal enhancer, etc. Their preparations are known by the technicians in cosmetics and toiletries or in the partial pharmaceutical field. As for other information of the carriers, the following reference is available "Remington: The Science and Practice of Pharmacy, 21st Ed., Lippincott, Williams & Wilkins (2005)", whose content are incorporated into this patent by means of referring.
- [0062] The term "excipient" usually refers to the carriers, diluents, and/or medium necessary to prepare effective pharmaceutical composition.
- [0063] With regard to a drug or a pharmacological active agent, the term "effective dose" or "therapeutically effective dose" refers to the level of a drug or agent that is non-toxic but adequate to achieve expected effect. As for the oral dosage form in the present invention, the "effective dose" of an active substance in the composition refers to the level necessary to achieve the expected effect in the case of combination with other active substance. The determination of such effective dose varies from person to person, depending on the age of receptor and the general conditions as well as the specific active substance. The individual appropriate effective dose can be determined according to the routine experiments by those skilled in the art.
- [0064] The terms "active ingredient", "therapeutic agent", "active substance" or "active agent" refer to a chemical entity that can effectively cure a targeted disorder, disease or symptom.
- [0065] The term "substituted" refers to that any one or several hydrogen atoms bonding to specific atom are replaced by substituting groups including deuterium or the variants of hydrogen as long as the valence state of the specific atom is normal and the compound after substitution is stable. If the substituting group is a ketone group (i.e., =O), it means that two hydrogen atoms are substituted. The ketone substitution will not occur to an aryl group. The term "optionally substituted" refers to that it can optionally be substituted or not substituted. Unless specified otherwise, the type and number of the substituting group are random on a chemically-achievable basis.
- [0066] In the event that any variable (e.g. R) appears more than once in the composition or structure of a compound, its definition is independent on a case by case basis. For example, if one group is substituted by 0-2 R, said group can be optionally substituted by up to two R and each of them can be selected independently in each case. Moreover, any combination of substituting groups and/or their variants can only be acceptable if such combination can give a stable compound.
- [0067] If one variable of them is selected from those with single bond, it means that the two groups it bonds to are connected directly, e.g. the single bond of "L" in "A-L-Z" denotes an actual structure of A-Z.
- [0068] If the bond of a substituting group can be cross-linked to two atoms of one ring, such substituting group can bond with any atom on the ring. If the enumerated substituting group is not specified as for the atom to bond a compound covered by the general formula of a chemical structure but not mentioned specifically, such substituting group can bond with any atom of it. Any combination of the substituting groups and/or their variants can only be acceptable if such combination can give a stable compound. e.g., the structural unit

indicates that it can substitute any position of the cyclohexyl group or

cyclo-diene.

- [0069] The substituting groups of alkyl and heteroalkyl radical are usually referred to as "alkyl substituents." They can be selected from but not limited to one or more from the following groups: -R', -OR', =O, =NR', =N-OR', -NR'R", -SR', halogen, -SiR'R" R"', OC(O)R', -C(O)R', -CO₂R', -CONR'R", -OC(O)NR'R", -NR"C(O)R',

NR'C(O)NR'R'', -NR'C(O)₂R', -NR''''-C(NR'R'R'')=NR''', NR'''C(NR'R'')=NR'', -S(O)R', -S(O)₂R', -S(O)₂NR'R'', NR'SO₂R', -CN, -NO₂, -N₃, -CH(Ph)₂ and fluoro(C₁-C₄) alkyl groups. The number of substituting groups is 0 ~ (2m'+1), where m' is the total number of carbon atoms in these atom radicals. The R', R'', R''', R'''' and R''''' are independently selected preferentially from hydrogen, the substituted or unsubstituted heteroalkyl groups, substituted or unsubstituted aryl groups (e.g., those substituted by 1 ~ 3 halogen atoms), the substituted or unsubstituted alkyl groups, alkoxy groups, thioalkoxy radicals or aralkyl groups. If a compound according to the present invention contains more than one R group, e.g., each R group is independently selected as if it is any from more than one R', R'', R''', R'''' and R'''''. If R' and R'' bond with the same N atom, they can form a 5-, 6- or 7-membered ring with this N atom, e.g., -NR'R'' refers to include but not limited to 1-pyrrolidinyl and 4-morpholinyl. As per the aforementioned discussion of substituting group, those skilled in the art can understand the term "alkyl group" refers to include the groups formed by the carbon atoms bonding with non-hydrogen groups, for example halogenated alkyls (e.g. -CF₃, -CH₂CF₃) and acyl groups (e.g. -C(O)CH₃, -C(O)CF₃, -C(O)CH₂OCH₃, etc).

[0070] Similar to said substituting groups of alkyl groups, the substituting groups of aryl groups and heteroaryl groups are generally referred to as "aryl substituents" and are selected from, e.g. -R', -OR', -NR'R'', -SR', -halogen, -SiR'R'' R''', OC(O)R', -C(O)R, -CO₂R', -CONR'R'', -OC(O)NR'R'', -NR'C(O)R', NR'C(O)NR'R'', -NR'C(O)₂R', -NR''''-C(NR'R'R'')=NR''', NR'''C(NR'R'')=NR'', -S(O)R', -S(O)₂R', -S(O)₂NR'R'', NR'SO₂R', -CN, -NO₂, -N₃, -CH(Ph)₂, fluoro(C₁-C₄) alkoxy and fluoro-(C₁-C₄) alkyl groups. The number of substituting groups is in the range of 0 to the total number of open valence of the aromatic ring, where R', R'', R''', R'''' and R''''' are independently selected respectively from hydrogen, the substituted or unsubstituted alkyl groups, the substituted or unsubstituted hetero alkyl groups, the substituted or unsubstituted aryl groups and the substituted or unsubstituted hetero aryl groups. If a compound according to the present invention contains more than one R group, e.g., each R group is independently selected as if it is any from more than one R', R'', R''', R'''' and R'''''.

[0071] The two substituting groups on two adjacent atoms of aryl group or hetero aryl group can be substituted by a group with the general formula as -T-C(O)-(CRR')_q-U-, where T and U are independently selected respectively from -NR-, -O-, CRR'- or single bond and q is an integer of 0 and 3. As an alternative, the two substituting groups on two adjacent atoms of aryl group or hetero aryl group can be replaced by a substituting group with a general formula of -A(CH₂)_r B-, where A and B are independently selected respectively from -CRR'-, -O-, -NR-, -S-, -S(O)-, S(O)₂-, -S(O)₂NR'- or single bond and r is an integer of 1 ~ 4. Optionally, one single bond on the new ring formed thereby can be replaced by double bond. As an alternative, the two substituting groups on two adjacent atoms of aryl group or hetero aryl group can be replaced by a substituting group with a general formula of -A(CH₂)_r B-, where s and d are integers of 0 ~ 3 respectively selected independently, X is -O-, -NR', -S-, -S(O)-, -S(O)₂- or -S(O)₂NR'-. The substituting group R, R', R'' and R'' ' are respectively selected independently from the preferential hydrogen and the substituted or unsubstituted (C₁-C₆) alkyl groups.

[0072] Unless specified otherwise, the term "halogenating element" or "halogen" denotes fluorine, chlorine, bromine or iodine atom by itself or as a part of other substituting group. In addition, the term "halogenated alkyl group" refers to the monohalogenated and polyhalogenated alkyl groups. For example, the term "halo(C₁-C₄)alkyl group" means to include but be not limited to trifluoromethyl, 2,2,2-trifluoroethyl, 4-chlorobutyl and 3-bromopropyl, etc.

[0073] The examples of halogenated alkyl groups include but are not limited to trifluoromethyl group, trichloromethyl group, pentafluoroethyl group and pentachlorophenol ethyl group. The "alkoxy group" denotes the aforementioned alkyl groups with specific number of carbon atoms linked by oxygen bridge. The C₁₋₆ alkoxy groups include those of C₁, C₂, C₃, C₄, C₅ and C₆. The examples of alkoxy groups include but are not limited to methoxy, ethoxy, n-butoxy, isobutoxy, n-butoxy, sec-butoxy, tert-butoxy, n-pentyloxy and S-pentyloxy group. The "cycloalkyl group" includes saturated ring group, e.g., cyclopropyl, cyclobutyl or cyclopentyl group. The 3-7 cycloalkyl group includes those of C₃, C₄, C₅, C₆ and C₇. The "alkenyl group" includes the linear or branched hydrocarbon chains, where any stable point on the chain has one or more carbon-carbon double bond, e.g. vinyl and allyl groups.

- [0074] The term "halogen" or "halogen element" refers to fluorine, chlorine, bromine, and iodine.
- [0075] Unless specified otherwise, the term "hetero" refers to a hetero atom or hetero atom radical (i.e., atom radical containing hetero atom), including the atoms except carbon (C) and hydrogen (H) and their atom radicals, e.g. O, N, S, Si, Ge, Al, B, -O-, -S-, =O, =S, -C(=O)O-, -C(=O)-, -C(=S)-, -S(=O), -S(=O)₂- and any one selected from the substituted -C(=O)N(H)-, -N(H)-, -C(=NH)-, -S(=O)₂N(H)- or -S(=O)N(H)-.
- [0076] Unless specified otherwise, the "ring" denotes a substituted or unsubstituted cycloalkyl group, heterocycloalkyl group, cycloalkenyl group, heterocycloalkenyl group, cycloalkynyl group, heterocyclyl alkynyl group, aryl, or heteroaryl group. The so-called ring includes monocycle, linked ring, spiro ring, bi-ring or bridged ring. The number of atoms in the ring is generally defined as the member number of ring, e.g., the "5~7 membered ring" means that 5 ~ 7 atoms are contained to form a ring. Unless specified otherwise, this ring optionally contains 1 ~ 3 hetero atoms. Thus, the "5~7 membered ring" includes, e.g. phenyl pyridine and piperidinyl group, on the other hand, the term "5~7 membered heterocycloalkyl ring" includes pyridyl group and piperidinyl group rather than phenyl group. The term "ring" includes the ring system containing at least one ring, where each "ring" independently conforms to the aforementioned definition.
- [0077] Unless specified otherwise, the term "heterocycle" or "heterocyclic group" refers to a monocycle, bi-cycle and tricycle containing hetero atoms or hetero atom radical. They can be saturated, partially saturated or unsaturated (aromatic) and consist of carbon atoms and 1, 2, 3 or 4 hetero atoms independently selected from N, O, and S, where any of the aforementioned heterocycles can be condensed together with benzene ring to form a bi-cycle. The N and S hetero atoms can be optionally oxidized (i.e., NO and S(O)_p). The N atom can be substituted or unsubstituted (i.e., N or NR where R is H or other substituting group already defined in the patent). The hetero ring can bond to the side group of any hetero atom or carbon atom to form stable structure. If the generated compound is stable, said heterocycle according to the present invention can undergo substitution on C atom or N atom and N atom in the heterocycle can be optionally quaternized. One preferential scheme is that the atoms will not be adjacent if the total number of S and O atoms in the heterocycle is over 1. Another preferential scheme is that the total number of S and O in the heterocycle will not exceed 1. As employed in the present invention, the term "aromatic heterocyclic group" or "heteroaryl group" refers to the aromatic rings with stable 5,6 or 7-membered monocycles or bi-cycles or 7, 8, 9 or 10-membered bicyclic heterocyclic group. It can contain carbons atoms and 1, 2, 3, or 4 hetero atoms of N, O and S independently selected from N, O and S. N atom can be substituted or unsubstituted (i.e., N or NR, where R is H or other substituting group already defined in the patent). N and S hetero atoms can be optionally oxidized (i.e., NO and S(O)_p). It is noteworthy that the total number of S and O atoms in the aromatic heterocycle will not exceed 1. The bridged rings are also covered by the definition of heterocycle. One or more atoms (i.e., C, O, N or S) will form a bridged ring when two non-adjacent C atoms or N atoms are linked. The preferential bridged rings include but are not limited to: one C atom, two C atoms, one N atom, two N atoms and one C-N group. It is noteworthy that one bridge always converts a monocycle ring into a tricycle. The substituting group in the ring can also be located on the bridge.
- [0078] The examples of heterocyclic compounds include but are not limited to acridinyl group, azocine group, benzimidazolyl group, benzofuranyl group, mercaptobenzofuranyl group, mercaptobenzophenyl group, benzoxazolyl group, benzoxazolyl group, benzothiazolyl group, benzotriazolyl group, benzotetrazolyl group, benzoisoxazolyl group, benzisothiazol group, benzimidazolyl group, carbazolyl group, 4a *H*- carbazolyl group, carboline group, chromanyl group, chromene, cinnoliny decahydroquinolyl group, 2*H*,6*H*-1,5,2-dithiazine group, dihydro-furo [2,3-*b*] tetrahydrofuran, furyl group, furazanyl group, imidazolidinyl group, imidazolinyl group, imidazolyl group, 1*H*-indazolyl group, indolenyl group, indoliny group, indoliziny group, indolyl group, 3*H*- indolyl group, isatino group, isobenzofuran group, pyranyl, isoindolyl group, isoindoline group, isoindolyl group, indolyl group, isoquinoliny group, isothiazolyl group, isoxazolyl group, methylenedioxy phenyl group, morpholino group, naphthyridinyl group, octahydro-isoquinoliny group, oxadiazolyl group, 1,2,3-oxadiazolyl group, 1,2,4-oxadiazolyl group, 1,2,5-oxadiazolyl group, 1,3,4-oxadiazolyl group, oxazolidinyl group, oxazolyl group,

isoxazolyl group, oxindole group, pyrimidinyl group, phenanthridine group, phenanthroline group, phenazine, phenothiazine, xanthine benzo group, phenoxazine group, phthalazinyl group, piperazinyl group, piperidinyl group, piperidonyl group, 4-piperidonyl group, piperonyl group, pteridinyl group, purinyl group, pyranyl group, pyrazolyl group, pyrazolidinyl group, pyrazolinyl group, pyrazolyl group, pyridazinyl group, pyridine-oxazole, pyridine-imidazole, pyridine-thiazole, pyridinyl group, pyrimidinyl group, pyrrolidinyl group, pyrrolinyl group, 2*H*-pyrrolyl group, pyrrolyl group, pyrazolyl group, quinazolinyl group, quinolinyl group, 4*H*-quinoliziny group, quinoxalinyl group, quinuclidinyl group, tetrahydrofuran group, tetrahydro-isoquinolinyl group, tetrahydroquinolinyl group, tetrazolyl group, 6*H*-1,2,5- thiadiazolyl group, 1,2,3-thiadiazolyl group, 1,2,4-thiadiazolyl group, 1,2,5-thiadiazolyl group, 1,3,4-thiadiazolyl group, thianthrenyl group, thiazolyl group, isothiazolyl thienyl group, thienyl group, thieno oxazolyl group, thienyl- thiazolyl group, thienyl-imidazolyl group, thienyl group, triazinyl group, 1,2,3-triazolyl group, 1,2,4-triazolyl group, 1,2,5-triazolyl group, 1,3,4-triazolyl group and xanthenyl group. The condensed ring compounds and spiro-compounds are also included.

- [0079] Unless specified otherwise, the term "hydrocarbyl group" or its inferior concept (e.g., alkyl, alkenyl, alkynyl and phenyl, etc) denotes a linear, branched, or cyclic hydrocarbon radical or its combination by itself or as part of other substituting group. It can be fully saturated, mono-unsaturated or poly-unsaturated, can be mono-substituted, di-substituted or poly-substituted, can be univalent (e.g. methyl group), divalent (e.g. methylene group) or multivalent (e.g. methine), can be divalent or multivalent atom radical with specified number of carbon atoms (for example C₁-C₁₀ indicating 1 to 10 carbon atoms). The "hydrocarbyl group" includes but is not limited to aliphatic group and aromatic group. Said aliphatic group includes chains and rings, specifically including but not limited to alkyl group, alkenyl group and alkynyl group. Said aromatic group includes but is not limited to 6-12 membered aromatic group, e.g. benzene and naphthalene, etc.
- [0080] In some embodiments, the term "alkyl group" denotes a linear or branched atom radical or their combination. It can be fully saturated, mono-unsaturated or poly-unsaturated and can be divalent and multivalent atom radical. The examples of saturated atom radical include but are not limited to the homologs or isomers of radicals such as methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, tert-butyl group, isobutyl group, sec-butyl group, isobutyl group, cyclohexyl group, (cyclohexyl) methyl group, cyclopropylmethyl group and n-pentyl group, n-hexyl group, n-heptyl group and n-octyl, etc. The unsaturated alkyl group comprises one or more double bonds or triple bonds and its examples include but are not limited to ethenyl group, 2-propenyl group, butenyl group, crotyl group, 2-isopentenyl group, 2- (butadienyl) group, 2,4-pentadienyl group, 3- (1,4-pentadienyl) group, ethynyl group, 1- and 3-propynyl group, 3-butyne group and their higher homologs and isomers.
- [0081] Unless specified otherwise, the term "heterohydrocarbyl group" or its inferior concept (e.g.heteroalkyl group, heteroalkenyl group, heteroalkynyl group and heteroaryl group, etc.) denotes a stable linear, branched or cyclic hydrocarbon radical or its combination by itself or in combination with other term and it consists of a number of carbon atoms and at least one hetero atom. In some embodiments, the term "heteroalkyl group" denotes a stable linear, branched hydrocarbon radical or its combination by itself or in combination with other term and it consists of a number of carbon atoms and at least one hetero atom. In a typical embodiment, the hetero atom is selected from B, O, N and S, where the N and S atoms are optionally oxidized and the N hetero atom is optionally quaternized. The hetero atoms B, O, N and S can be located at any internal position of heterohydrocarbyl group (including the positions except that where the hydrocarbon group is bonded). The examples include but are not limited to -CH₂-CH₂-O-CH₃, -CH₂-CH₂-NH-CH₃, -CH₂-CH₂-N(CH₃)-CH₃, -CH₂-S-CH₂-CH₃, -CH₂-CH₂, -S(O)-CH₃, -CH₂-CH₂-S(O)₂-CH₃, -CH=CH-O-CH₃, -CH₂-CH=N-OCH₃ and -CH=CH-N(CH₃)-CH₃. No more than two hetero atoms are consecutive, e.g. CH₂-NH-OCH₃.
- [0082] The term "alkoxy group", "alkylamino group" and "alkylthio group" (thioalkoxy group) is idiomatic expression and refers to those alkyl groups bonded to other parts of the molecule via O atom, amino group or S atom.
- [0083] Unless specified otherwise, the term "cyclic hydrocarbon group", "heterocyclic hydrocarbon group" or their

inferior concepts (e.g. aryl group, heteroaryl group, cycloalkyl group, heterocycloalkyl group, cycloalkenyl group, heterocycloalkenyl group, cycloalkynyl group and heterocyclyl alkynyl group, etc) denote respectively the cyclic "hydrocarbon group" and "hetero hydrocarbon group" by itself or in combination with other term. In addition, as for the hetero hydrocarbon groups or heterocyclic hydrocarbon groups (e.g. hetero alkyl group and heterocyclic alkyl group), the hetero atom can occupy other positions except that the hetero ring bonds to the molecule. The examples of cycloalkyl group include but are not limited to cyclopentyl group, cyclohexyl group, 1-cyclohexenyl group, 3-cyclohexenyl group and cycloheptyl group, etc. The non-restrictive examples of heterocyclic group include 1- (1,2,5,6-tetrahydropyridyl) group, 1-piperidinyl group, 2-piperidinyl group, 3-piperidinyl group, 4-morpholinyl group, 3-morpholinyl group, tetrahydrofuran-2-yl group, tetrahydrofuran-3-yl group, tetrahydro-thiophen-2-yl group, tetrahydro-thiophen-3-yl group, 1-piperazinyl group and 2-piperazinyl group.

[0084] Unless specified otherwise, the term "aryl group" denotes poly-unsaturated aromatic substituent and can be monosubstituted, disubstituted or polysubstituted. It can be monocyclic or polycyclic (preferably 1 to 3 rings) and can be condensed together or linked covalently. The term "heteroaryl group" refers to aryl group (or ring) containing one to four hetero atoms. In a demonstrative embodiment, the hetero atom is selected from B, O, N and S, where the N and S atoms are optionally oxidized and the N hetero atom is optionally quaternized. The heteroaryl group can bond to other part of the molecule via hetero atom. The non-restrictive embodiments of aryl group or heteroaryl group include phenyl group, 1-naphthyl group, 2-naphthyl group, 4-biphenyl group, 1-pyrrolyl group, 2-pyrrolyl group, 3-pyrrolyl group, 3-pyrazolyl group, 2-imidazolyl group, 4-imidazolyl group, pyrazinyl group, 2-oxazolyl group, 4-oxazolyl group, 2-phenyl-4-oxazolyl group, 5-oxazolyl group, 3-isoxazolyl group, 4-isoxazolyl group, 5-isobutyl oxazolyl group, 2-thiazolyl group, 4-thiazolyl group, 5-thiazolyl group, 2-furyl group, 3-furyl group, 2-thienyl group, 3-thienyl group, 2-pyridyl group, 3-pyridyl group, 4-pyridyl group, 2-pyrimidinyl group, 4-pyrimidinyl group, 5-benzothiazolyl group, purinyl group, 2-benzimidazolyl group, 5-indolyl group, 1-isoquinolyl group, 5-isoquinolyl group, 2-quinoxalyl group, 5-quinoxalyl group, 3-quinolyl group and 6-quinolyl group. Any aforementioned substituting group of aryl and heteroaryl ring is selected from the acceptable substituting group described as follows.

[0085] For simplicity, the aryl group to be used in combination with other term (e.g. aryloxy group, arylthio group and aralkyl group) includes the aryl group and heteroaryl ring as defined above. Thus, the term "aralkyl group" means to include those radicals via which the aryl group bonds to the alkyl group (e.g. benzyl, phenethyl, pyridylmethyl etc), including those alkyl groups that any C atom (e.g. methylene) is replaced by O atom, e.g., phenoxymethyl group, 2-pyridyloxy methyl-3-(1-naphthyloxy) propyl group, etc.

[0086] The term "leaving group" refers to a functional group or atom that can be replaced by another functional group or atom via substitution reaction (e.g., nucleophilic substitution reaction). For example, the representative leaving groups include triflate; chloro, bromo, iodo; sulfonate group such as mesylate, tosylate, brosylate, p-toluenesulfonate, etc; acyloxy group such as acetoxy group and trifluoroacetyl group, etc.

[0087] The term "protecting group" includes but is not limited to "amino protecting group", "hydroxy protecting group" or "mercapto-protecting group". The term "amino protecting group" refers to the protecting groups suitable to prevent secondary reaction on the position of amino nitrogen. The representative amino protecting groups include but are not limited to: formyl group; acyl groups such as alkanoyl group (e.g. acetyl group, trichloroacetyl group or trifluoroacetyl group); alkoxycarbonyl group such as tert-butoxycarbonyl (Boc); arylmethoxycarbonyl groups such as benzyloxycarbonyl (Cbz) and 9-fluorenyl methoxycarbonyl (Fmoc); arylmethyl group such as benzyl group (Bn), trityl group (Tr), 1,1-di-(4'-methoxyphenyl) methyl group; silyl groups such as trimethylsilyl group (TMS) and tert-butyldimethylsilyl (TBS), etc. The term "hydroxy protecting group" refers to the protecting groups suitable to prevent secondary reaction of hydroxy group. The representative hydroxy groups includes but are not limited to: alkyl groups such as methyl group, ethyl group and t-butyl group; acyl groups such as alkanoyl groups (e.g. acetyl group); arylmethyl groups such as benzyl (Bn), p-methoxybenzyl group (PMB), 9-fluorenyl methyl (Fm) and diphenylmethyl group (benzhydryl, DPM); silyl groups such as trimethylsilyl group (TMS) and

tert-butyldimethylsilyl (TBS), etc.

- [0088] The compound(s) according to the present invention can be prepared via many synthesis methods known by those skilled in the art, which include the following embodiments, the implementation ways formed by them with other chemical synthesis methods and the equivalent replacements known by those skilled in the art. The preferred embodiments include but are not limited to the examples according to the present invention.
- [0089] All the solvents used in the present invention are commercially available and can be used directly without further purification. The present invention employs the following abbreviations: aq denoting water; HATU denoting O-(7-aza-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate; EDC denoting N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride; m-CPBA denoting 3-chloroperoxybenzoic acid; eq denoting equivalent and equal amount; CDI denoting carbonyl diimidazole; DCM denoting dichloromethane; PE denoting petroleum ether; DIAD denoting diisopropyl azodicarboxylate; DMF denoting N,N-dimethylformamide; DMSO denoting dimethylsulfoxide; EtOAc denoting ethyl acetate; EtOH denoting ethanol; MeOH denoting methanol; CBz denoting benzyloxycarbonyl that is an amine-protecting group; BOC denoting tert-carbonyl that is an amine-protecting group; HOAc denoting acetic acid; NaCNBH₃ denoting sodium cyanoborohydride; r.t. denoting room temperature; O/N denoting over night; THF denoting tetrahydrofuran; Boc₂O denoting di-tert-butyl dicarbonate; TFA denoting trifluoroacetate; DIPEA denoting diisopropylethyl amine; SOCl₂ denoting thionyl chloride; CS₂ denoting carbon disulfide; TsOH denoting p-toluene sulfonic acid; NFSI denoting N-fluoro-N-(phenylsulfonyl) benzenesulfonamide; NCS denoting 1-chlorine pyrrolidine-2,5-diketone; *n*-Bu₄NF denoting tetrabutylammonium fluoride; *i*PrOH denoting 2-propanol; mp denoting melting point; LDA denoting lithium diisopropylamide; Xantphos denoting 4,5-bisdiphenylphosphino-methyl-9,9-xanthene; Pd₂(dba)₃ denoting tris(dibenzylideneacetone) dipalladium; DAST denoting diethylaminosulphur trifluoride; Pd(dppf)Cl₂ denoting 1,1'-bis(diphenylphosphino) ferrocene; PCC denoting pyridinium chlorochromate; TsCl denoting toluenesulfonyl chloride; Et₃N denoting triethylamine.
- [0090] The compound(s) are named manually or via ChemDraw® software. The commercially-available compounds are used with the names from supplier directory.
- [0091] Compared with the existing technologies, the compound(s) according to the present invention is efficient with low toxicity and realizes obvious or even unexpected progress in the factors such as activity, half time, solubility and pharmacokinetics and hence more suitable to prepare pharmaceuticals.

DESCRIPTION OF THE EMBODIMENTS

- [0092] In order to describe the present invention in more detail, the following examples are provided although the scope of the present invention is not limited to them.

Route B

- [0093] Embodiment 4
2-(5-((4-fluorophenoxy) pentyl)-5-(pyridin-4-yl)-1,2,5-thiadiazole-1,1-dioxide

[0094] Embodiment 4A

2-((2-chloropyridine-4-yl) amino) ethanol

[0095] Agitate the solution of 2,4-dichloropyridine (100g, 675.7mmol), triethylamine (136.7g, 1.35 mol) and 2-aminoethanol (41.3g, 675.7mmol) in ethanol (500ml) 72 hours at 100 °C and then allow it to undergo rotary evaporation to remove the solvents. Then purify the residue through the chromatography column and yield the title compound (yellow oil, 46g, yield of 40%). ¹H-NMR(CDCl₃,400MHz) δ 7.90(d, J=5.8Hz, 1H), 6.49(d, J=2.0Hz, 1H), 6.41(dd, J=5.8, 2.0Hz, 1H), 5.17(brs, 1H), 3.87(t, J=5.1Hz, 2H), 3.31(q, J=5.0Hz, 2H); LCMS(ESI)m/z:173(M+1).

[0096] Embodiment 4B

2-chloro-N-(2-chloroethyl) pyridin-4-amine

[0097] Dissolve Embodiment 4A (5g, 28.9mmol) in the mixture solvent of dichloromethane and N, N- dimethylformamide (50ml/5ml) and then drop the thionyl chloride (60ml) into this mixture solution at 15 °C before heat to 40 °C to react for 16 hours. Then cool the system to room temperature and pour ice water (200ml) into it. Then add 1mol/L aqueous NaOH solution to adjust pH value to 10. Extract the aqueous layer with ethyl acetate (100ml x 6) and wash the combined organic layers with saline (50ml) before dry with Na₂SO₄. Then filter and evaporate to get the crude product. Then purify the crude product via the chromatography column to obtain the title compound (white solid, 1.7g, yield of 45%) and recycle the raw materials (white solid, 2.0g). LCMS (ESI) m/z: 191 (M+1). ¹H-NMR (CDCl₃, 400MHz) δ 7.99 (d, J=6.0Hz, 1H), 6.38-6.55 (m, 2H), 4.75 (brs, 1H), 3.67-3.78 (m, 2H), 3.55(q, J=5.5Hz, 2H).

[0098] Embodiment 4C

N-(2-chloroethyl)-N-(2-chloropyridin-4-yl) aminosulfonyl tert-Butyl carbamate

[0099] Under the protection of N₂ gas at 0 °C, drop the chlorosulfonyl isocyanate (2.7ml) into the solution of tert-butanol (3.4ml) in dichloromethane (27ml). After the dropping is completed, heat the solution gradually to room temperature and then continue to agitate 30 minutes to clear up. Transfer the solution at vacuum into a constant pressure funnel to mix with triethylamine (11.6ml). Then under the protection at 0 °C, drop the aforementioned mixture solution into the solution of Embodiment 4B (1.7g, 8.9mmol) in dichloromethane (20ml). After the dropping is completed, agitate the solution 48 hours at 12 °C before quench with ice water. Then extract the aqueous phase with dichloromethane (50ml x 4). Dry the combined organic layers with Na₂SO₄ before filtering and evaporation to obtain the crude product (7g) of the title compound that can be directly used without necessity to purify any more. ¹H-NMR (CDCl₃, 400MHz) δ 8.45 (d, J=5.5Hz, 1H), 7.42 (d, J=1.5Hz, 1H), 7.34 (dd, J=5.3, 1.8Hz, 1H), 4.32 (t, J=6.4Hz, 2H), 3.67 (t, J=6.3Hz, 2H), 1.49 (s, 9H); LCMS (ESI)m/z:370 (M+1).

[00100] Embodiment 4D

5-(2-chloropyridine-4-yl)-1,2,5-thiadiazolidine-2-tert-Butyl carboxylate-1,1-dioxide

[00101] At 15°C, add K₂CO₃ powder (3.4g) into the solution of Embodiment 4C (7g, crude product) in dimethylsulfoxide (30ml) and agitate 3 hours. Then pour it into 1 L water and filter to obtain the white solid. Dissolve the solid in dichloromethane and then dry with Na₂SO₄ before filter and evaporate to obtain the title compound (2g, yield of 69%). ¹H-NMR(CDCl₃, 400MHz) δ 8.32 (d, J=6.0Hz, 1H), 7.06-7.21 (m, 2H), 3.98-4.12 (m, 2H), 3.79-3.92 (m, 2H), 1.59 (s, 10H). LCMS(ESI) m/z: 334(M+1).

[00102] Embodiment 4E

2-(2-chloropyridine-4-yl)-1,2,5-thiadiazolidine-1,1-dioxide

[00103] Add ethyl acetate hydrochloride (4mol/L, 40ml) into the mixture solution of Embodiment 4D (1.9g, 5.69mmol) in ethyl acetate / methanol (40ml/4ml) and agitate it 5 hours at 60°C. After removing the solution at vacuum, adjust the pH value of the residue with saturated sodium bicarbonate solution to 8. Extract the aqueous layer with ethyl acetate (250ml x 3) and dry the combined organic layers with Na₂SO₄ before filter and evaporate to obtain the title compound (white solid, 1.2g, 92%). ¹H-NMR (CDCl₃, 400MHz) δ 8.29 (d, J=5.8Hz, 1H), 7.05-7.09 (m, 1H), 7.00 (d, J=2.0Hz, 1H), 3.95-3.99 (m, 2H), 3.78-3.85 (m, 2H); LCMS (ESI) m/z: 234(M+1).

[00104] Embodiment 4F

2-(pyridin-4-yl)-1,2,5-thiadiazolidine-1,1-dioxide

[00105] Mix Embodiment 4E (1.3g, 5.5mmol), Pd/C (100mg) and triethylamine (2ml) into methanol (30ml). Agitate this mixture 12 hours at 25°C before filter. Then remove the solvent at vacuum to obtain the title compound (3.8g, yield of 100%) that can be directly used without necessity to purify any more. ¹H-NMR (DMSO-d₆, 400MHz) 8.75(s, br, 1H), 8.68 (d, J=7.0Hz, 2H), 7.45 (d, J=7.0Hz, 2H), 4.08 (t, J=6.3 Hz, 2H), 3.64 (d, J=6.3 Hz, 2H); LCMS (ESI) m/z: 200(M+1).

[00106] Embodiment 4G

1-(5-bromopentyl)oxy-4-fluorobenzene

[00107] Add K₂CO₃ (14.79g, 107mmol), KI (0.59g, 3.6mmol) and 1,5-dibromopentane (24.61g, 107mmol) into the solution of p-fluorophenol (4g, 35.68mmol) in acetone (40ml). Agitate the mixture solution 12 hours at 80°C. Then extract it with ethyl acetate. Dry the organic phase with anhydrous Na₂SO₄ before filter and evaporate. Then purify the residue with chromatography column (petroleum ether: ethyl acetate =10:1) to obtain the title compound (white solid, 6.6g, yield of 70.8%). ¹H-NMR (CDCl₃, 400MHz) δ 6.93-7.01 (m, 2H) 6.79-6.86 (m, 2H) 3.90-3.97 (m, 2H) 3.45 (t, J=6.8Hz, 2H) 1.94 (q, J=7.2Hz, 2H) 1.76-1.86 (m, 2H) 1.60-1.68 (m, 2H). LCMS (ESI) m/z: 262 (M+1).

[00108] Embodiment 4H

2-(5-((4-fluorophenoxy) pentyl) -5-(pyridin-4-yl) -1,2,5-thiadiazolidine-1,1-dioxide

[00109] At 0°C, add sodium hydride (6mg, 0.16mmol, 60% content) into the solution of Embodiment 4F (30mg, 0.15mmol) in N, N-dimethylformamide (2ml). Keep it still 30 minutes at 0°C. Then add the solution of Embodiment 4G (39.3mg, 0.15mmol) in N, N-dimethylformamide (1ml) into the aforementioned mixture solution. Agitate it 6 hours at 15°C. Then add water to quench the reaction and extract the aqueous phase with ethyl acetate. Dry the combined organic phases with anhydrous Na₂SO₄ before filter and evaporate. Then separate it with HPLC to obtain the title compound (white solid, 28mg, yield of 49%). ¹H-NMR (400MHz, CDCl₃) δ 8.51 (d, J=6.0 Hz, 2H), 7.05 (d, J=5.5Hz, 2H), 6.91-7.01 (m, 2H), 6.82 (dd, J=9.0, 4.0Hz, 2H), 3.93 (t, J=6.3 Hz, 2H), 3.84 (t, J=6.5Hz, 2H), 3.54 (t, J=6.3Hz, 2H), 3.18 (t, J=7.0Hz, 2H), 1.72-1.87 (m, 5H), 1.56-1.61 (m, 1H). LCMS (ESI), m/z: 380 (M+1).

2- (5-((4'-chloro-[1,1'-biphenyl]-4-yl)oxy) pentyl)-5-(pyridin-4-yl)-1,2,5-thiadiazolidine-1,1-dioxide

[00116] Embodiment 6A

4'-chloro - [1,1'-biphenyl] -4-ol

[00117] Mix 4-bromophenol (62g, 360mmol), 4-chlorophenyl boronic acid (56g, 360mmol), Pd(dppf)Cl₂ (10g, 10mmol) and Na₂CO₃ (76g, 720mmol) into THF/H₂O (600ml/100ml) and heat this mixture 6 hours at 70 °C under the protection of N₂. Pour the reaction mixture into water and extract with ethyl acetate. Dry the combined organic phases with anhydrous Na₂SO₄ before filter and evaporate. Then purify the residue with chromatography column (petroleum ether: ethyl acetate =20:1) to obtain the title compound (60g, yield of 80%). LCMS(ESI)m/z:205(M+1).

[00118] Embodiment 6B

4-((5-bromopentyl)oxy)-4'-chloro-1,1'-biphenyl

[00119] Add 1,5-dibromopentane (67g, 293.2mmol), K₂CO₃ (27g, 195.4mmol) and KI (1.62g, 9.77mmol) into the solution of Embodiment 6A (20g, 97.72mmol) in acetone (200ml). After the substances are added, heat the mixture solution 12 hours at 80 °C. After the reaction is completed, filter the reaction solution and then concentrate the filtrate. Then add petroleum ether (200ml) into the residue and agitate the system 2 hours at 0 °C before filter to obtain the solid as the title compound (white solid, 25g, yield of 75%). ¹H-NMR (400MHz, CDCl₃) 7.48 (dd, J=2.01, 8.53 Hz, 4H), 7.35-7.41 (m, 2H), 6.91-7.00 (m, 2H), 3.96-4.06 (m, 2H), 3.41-3.50 (m, 2H), 1.96 (q, J=7.15 Hz, 2H), 1.80-1.90 (m, 2H), 1.60-1.71 (m, 2H).

[00170] Embodiment 12C

3-ethoxy-6-methoxy-benzo[d]isoxazole

[00171] In ice bath, add sequentially anhydrous ethanol (3.5g, 76mmol) and triphenylphosphine (24g, 90mmol) into the solution of Embodiment 12B (10g, 60mmol) in anhydrous THF (200ml). Then add slowly DIAD (18ml, 90mmol) into the solution above and agitate it to react 15 minutes at 0°C. Heat slowly it to room temperature and agitate over night. After the reaction ends, add water (200ml) to quench the reaction. Then extract the aqueous layer with ethyl acetate (200ml x 2). Then wash the combined organic layers with water and saline water sequentially. Then dry it with anhydrous Na₂SO₄ before filter and evaporate. Then purify the residue with the silica gel column chromatography to obtain the title compound (5.6g, yield of 48%). LCMS(ESI)m/z: 194(M+1).

[00172] Embodiment 12D

3-ethoxy-benzo[d]isoxazole-6-ol

[00173] Under the protection of N₂ gas at -78°C, drop slowly boron tribromide (4.2g, 16.8 mmol) into the solution of Embodiment 12C (810mg, 4.2mmol) in dichloromethane (10ml). After the dropping is completed, heat the reaction solution slowly to room temperature and agitate over night. After the reaction is completed, drop slowly the reaction solution into ice water (100ml) to quench the reaction. Then extract the aqueous layer with ethyl acetate (100ml x 2). Then wash the combined organic layers with water and saline water. Then dry it with anhydrous Na₂SO₄ before filter and evaporate to obtain the title compound (650mg, yield of 86.7%).

[00317] Embodiment 32A

N-t-butyl-N-(2-chloroethyl)-sulfonyleurea

[00318] Under the protection of N_2 gas at $0^\circ C$, drop the solution of N-(oxymethylene)-sulfamoyl chloride (244g, 1.73mol) in dichloromethane (1.0L) into t-butanol (453g, 2.1mol) in 1 hour. After the substances are added, agitate the mixture solution 1 hour at $25^\circ C$. Add the mixture of this mixture solution and triethylamine (872g, 8.6mol) into the solution of 2-chloro-ethylamine (200g, 1.73mol) in chloromethane (2L) in 2 hours. Agitate the mixture solution 10 hours at $25^\circ C$ before filter. Then concentrate the filtrate before dissolve it in 2L water. Then adjust it with 4N salt to pH = 5-6. A large amount of solids will precipitate out. Then filter the solids and wash them with petroleum ether (1L) to obtain the title compound (white solid, 350g, yield of 78.5%) that can be directly used without necessity to purify further.

4-(5-(5-(4-(2-ethyl-tetrazol-5-yl)-phenoxy)-3,3-dimethyl-pentyl)-1,1-dioxo-1,2,5-thiadiazolidine-2-yl)-pyridin-2-amine

[00582] Embodiment 76A

3,3-dimethylpentyl-1,5-bis(4-methylbenzenesulfonate)

[00583] Please refer to the preparation method of Embodiment 14A for this embodiment. ¹H

NMR(400MHz,CDCl₃)7.77(d,J=8.53Hz,2H),7.35(d,J=8.03Hz,2H),4.02(t,J=7.03Hz,2H),2.45(s,3H),1.55(t,J=7.03Hz,2H),0.84(s,3H).

[00584] Embodiment 76B

5-(4-(2-ethyl-2H-tetrazol-5-yl)-phenoxy)-3,3-dimethyl-pentyl-4-methylbenzenesulfonate

[00585] Add K₂CO₃ (8.72g, 63.29mmol) and KI (5.24g, 31.55mmol) into the solution of Embodiment 76A (6g, 31.55mmol) and Embodiment 11A (2.6g, 31.55mmol) in acetone solution (100ml). Agitate the mixture solution 12 hours at 80°C. Then extract it with ethyl acetate. Dry the organic phase with anhydrous Na₂SO₄ before filter and evaporate. Then purify the residue with column chromatography (petroleum ether: ethyl acetate =10:1) to obtain the title compound (white solid, 8.0g, yield of 56%). ¹H

NMR(400MHz,CDCl₃)8.09(d,J=8.5Hz,2H),7.00(d,J=8.8Hz,2H),4.70(q,J=7.3Hz,2H),4.38(t,J=7.4Hz,2H),4.11(t,J=6.8Hz,2H),3.0-3.04(m,3H),1.80-1.87(m,4H),1.70(t,J=7.4Hz,3H),1.08(s,6H). LCMS(ESI)m/z:459(M+1).

[00586] Embodiment 76C

5-(4-(2-ethyl-2H-tetrazol-5-yl)-phenoxy)-3,3-dimethyl-pentyl-1,2,5-thiadiazolidine-1,1 dioxide

[00587] At 0°C, add sodium hydride (41.9mg, 1.7mmol) into the solution of Embodiment 76B (969mg, 4.4mmol) in N, N-dimethylformamide (5ml). Keep it still 30 minutes at 0°C. Then add the solution of Embodiment 32B (400mg, 0.87mmol) in N, N-dimethylformamide (1ml) into the mixture solution above. After agitate it at 20°C to react for 2 hours, add K₂CO₃ (0.24mg, 1.7mmol) into the reaction solution. Then add water to quench the reaction and extract the aqueous phase with ethyl acetate. Dry the combined organic phases with anhydrous Na₂SO₄. Then filter and evaporate it before separating it with column (petroleum ether: ethyl acetate=1:1) to obtain the title compound (yellow oily form, 100mg, yield of 28%). ¹H

[00590] **Experimental example 1: Test of EV71 In-Vitro Cytopathic Effect (CPE)**

[00591] Purpose of experiment:

[00592] To test the in-vitro antiviral activity and cytotoxicity of a compound to HFMD virus EV71 by means of cytopathic effect (CPE) test.

[00593] Test materials:

1. Virus strain: Shenzhen/120F1/09
2. Cell line: RD cells of human rhabdomyoma
3. Cell culture media: DMEM medium added with 10% serum, Penicillin/Streptomycin and L-Glutamine(1×)
4. Test reagent: cellular activity test reagent CCK8

[00594] Test method:

1. Cell inoculation: digest off the RD cells from the attached state, then dilute them with culture medium to a density of 80000/ml and inoculate 100µl into the micro wells the 96-well plate.
2. Dilution of compound:
Step 1: prepare the dry powder of a compound to test into a 10mM solution in DMSO. Then dilute the compound by three times to eight concentration points. Dilute the reference compounds with the same method.
Step 2: further dilute the diluted solution of the compound in DMSO with cell culture medium. Add 10µlDMSO solution for each well into 240µl culture medium.
3. Add the diluted compound solution by 50µl each well into the 96-well plate inoculated with cells (double holes, final concentration of DMSO is 1%).
4. Dilution of virus: dilute EV71 virus solution by 10000 times to a concentration of 100TCID₅₀/50µl/. Add the diluted virus solution by 50µl each well into the 96-well plate. Prepare another 96-well plate to replace the virus with culture medium and similarly inoculate the cells. Add the compound to test the toxicity of compound on cells.
5. Cultivate the 96-well plate 3 days at the conditions of 37°C and 5% CO₂.
6. EC50 and CC50 tests: add the cellular activity test reagent CCK8 into the micro-wells by 20µl/well. Use ELIASA to read the absorbancy at the wavelength of 450nm and 630nm.
7. Analysis of data: analyze the data with Prism5.0 and calculate the antiviral activity of EC50 and the cellular toxicity of C50 of the compound.

[00595] The result is as shown in Table 1:

Claims

[00596] 1. A compound(s) or its pharmaceutically-acceptable salt(s) as shown by Formula (II),

[00597] [0006] R₃ is any selected from 5-membered heterocycles, C₆₋₁₂ aryl groups, C₆₋₁₂ alkyl groups, C₅₋₁₂ heteroaromatic rings and C₅₋₁₂ heteroaryl groups substituted with R₀₁;

[00598] L₂ is independently selected respectively from

[00599] m₁ and m₂ are independently selected respectively from 0, 1, 2, 3, 4, 5 or 6;

[00600] X₁ and X₂ are independently selected from single bond, -C(R_{d1})(R_{d2})-, -C(=O)N(R_{d3})-, -N(R_{d4})-, -C(=NR_{d5})-, -S(=O)₂N(R_{d6})-, -S(=O)N(R_{d7})-, -O-, -S-, -C(=O)O-, -C(=O)-, -C(=S)-, -S(=O)- or -S(=O)₂-;

[00601] R₄ is selected from 5~14-membered cyclic hydrocarbyl or heterocycloalkyl groups,

[00602] R_{d1} and R_{d2} are independently selected respectively from H, F, Cl, Br, I, CN, OH, SH, NH₂, CHO, COOH or any selected from C₁₋₁₀ alkyl or heteroalkyl groups and C₃₋₁₀ cyclic hydrocarbyl or heterocycloalkyl groups substituted with R₀₁, C₁₋₁₀ alkyl or heteroalkyl groups substituted with C₃₋₁₀ hydrocarbyl or heterocycloalkyl groups;

[00603] R₀₁ is selected from F, Cl, Br, I, CN, OH, SH, NH₂, CHO, COOH, R₀₂;

[00604] R₀₂ is selected from C₁₋₁₀ alkyl groups, C₁₋₁₀ alkylamino groups, N,N-(C₁₋₁₀ alkyl) amino groups, C₁₋₁₀ alkoxy groups, C₁₋₁₀ alkanoyl groups, C₁₋₁₀ alkoxycarbonyl groups, C₁₋₁₀ alkylsulfonyl groups, C₁₋₁₀ alkylsulfinyl groups, C₃₋₁₀ cycloalkyl groups, C₃₋₁₀ cycloalkylamino groups, C₃₋₁₀ heterocyclic alkyl amino groups, C₃₋₁₀ cycloalkoxy groups, C₃₋₁₀ cycloalkyl acyl groups, C₃₋₁₀ cycloalkoxy-carbonyl groups, C₃₋₁₀ cycloalkylsulfonyl groups and C₃₋₁₀ cycloalkylsulfinyl groups;

[00605] the "hetero" represents a hetero atom or hetero atom radical selected from -C(=O)N(R_{d3})-, -N(R_{d4})-, -C(=NR_{d5})-, -S(=O)₂N(R_{d6})-, -S(=O)N(R_{d7})-, -O-, -S-, =O, =S, -C(=O)O-, -C(=O)-, -C(=S)-, -S(=O)- and/or -S(=O)₂;

[00606] R_{d3-d7} is independently selected from H, R₀₃;

[00607] R₀₃ is selected from C₁₋₁₀ alkyl groups, C₁₋₁₀ alkanoyl groups, C₁₋₁₀ alkoxycarbonyl groups, C₁₋₁₀ alkylsulfonyl groups, C₁₋₁₀ alkylsulfinyl groups, C₃₋₁₀ cycloalkyl groups, C₃₋₁₀ cycloalkyl acyl groups, C₃₋₁₀ cycloalkoxy-carbonyl groups, C₃₋₁₀ cycloalkylsulfonyl groups and C₃₋₁₀ cycloalkylsulfinyl groups;

[00608] R₀₂ and R₀₃ are any substituted necessarily by R₀₀₁;

[00609] R₀₀₁ is selected from F, Cl, Br, I, CN, OH, N(CH₃)₂, NH(CH₃), NH₂, CHO, COOH, trifluoromethyl group, aminomethyl group, hydroxymethyl group, methyl group, methoxy group, formyl group, methoxycarbonyl group, methylsulfonyl group and methylsulfinyl group;

[00610] the number of R₀₁, R₀₀₁ and hetero atom or hetero atom radical is independently selected respectively from 0, 1, 2 or 3;

[00611] optionally, R_{d1} and R_{d2} interconnect together to form a 3 or 4-membered carbocyclic or heterocyclic ring.

[00612] 2. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 1, where: R₃ is any selected from substituted 5 ~ 6 membered aryl and substituted heteroaryl group;

[00613] preferentially, R₃ is any selected optionally from pyridyl group, phenyl group, furanyl group, pyrazolyl group, pyrrolyl group, thiazolyl group, pyridazinyl group, pyrimidinyl group and thienyl group substituted by R₀₁ and the definition of R₀₁ is as claim 1 and the number of R₀₁ is selected from 0, 1 2 or 3;

[00614] preferentially, R₀₁ is selected from F, Cl, Br, I, CN, OH, SH, NH₂, CHO, COOH,

[00615] 3. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 2, where: R₃ is selected from:

[00616] 4. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 1, wherein: L₂ is selected from:

[00617] preferentially, X_1 , X_2 are independently selected respectively from single bond, -O-, -C(=O)-, -CH(CH₃)-,

[00618] more preferentially, L₂ is selected from:

[00619] 5. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 1, where: R₄ is selected from the following:

[00620] T₄₋₇ is independently selected respectively from N or C(R₁);

[00621] D₁₋₃, D₅ and D₆ are independently selected respectively from single bond, -C(R_{d1})(R_{d2})-, -C(=O)N(R_{d3})-, -N(R_{d4})-, -C(=NR_{d5})-, -S(=O)₂N(R_{d6})-, -S(=O)N(R_{d7})-, -O-, -S-, -C(=O)O-, -C(=O)-, -C(=S)-, -S(=O)- or -S(=O)₂;

[00622] n_2 is selected from 0, 1, 2 or 3;

[00623] n_3 is selected from 0, 1 or 2;

[00625] 6. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 5, where: R₄ is selected from

the following:

[00627] 7.Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 5 or claim 6, wherein: R₅₋₇ are independently selected respectively

[00631] R₁₀ is selected from F, Cl, Br, I, CN, OH, SH, NH₂, CHO, COOH or any selected from C₁₋₁₀ alkyl or heteroalkyl groups and C₃₋₁₀ cyclic hydrocarbonyl or heterocycloalkyl groups substituted with R₀₁, C₁₋₁₀ alkyl or heteroalkyl groups substituted with C₃₋₁₀ hydrocarbonyl or heterocycloalkyl groups.

[00632] 8. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 7, wherein: R₅₋₉, R₀₁ and R_t are independently selected respectively from the following:

[00633] 9. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 8, wherein: said R₄ is selected from the following:

[00634] 10. Said compound(s) or its pharmaceutically-acceptable salt(s) according to claim 1, which is selected from the following:
