

ABSTRACT

METHOD, DEVICE, APPARATUS, AND STORAGE MEDIUM FOR GENERATING IDENTIFICATION INFORMATION

A method for generating identification information is disclosed including: when a terminal receiving a data acquisition instruction from a server, and then collecting data according to the data acquisition instruction; storing the data, and updating the data to the server to enable the server to issue a rule of generating identification information, to generate the identification information of the terminal; storing the identification information of the terminal that could be used as current identification information when install application action is detected. A device for generating identification information have the same is disclosed. The rule of generating identification information issued by the server and the data collected by the terminal are invariant, and hence the obtained identification information is invariant, ensuring the stability of generating identification information.
