

Abstract: (Fig. 1)

"DATA PROCESSING APPARATUS"

5 All data are uniformly and automatically processed
in a data processing system. An input record is trans-
formed into a record having a uniform format. All file
formats are unified. A desired record is read out from
10 a file and transformed into a arbitrary format. Data
input processing, a file update processing, and data
output processing are designed to process data indepen-
dently, uniformly, and automatically. A process content
to be performed by each of the data input, file update,
10 and data output processings is designated by a simple
data item such as a record keyword and a data word.
