(54) Title: SYSTEMS AND METHODS FOR MANAGING ACCESS CREDENTIAL REQUESTS

Fig. 5

(57) Abstract: Described embodiments relate to a computer-implemented method comprising: receiving, from an authorization server, an access credentials read request associated with a user. The access credentials read request comprises one or more access credential identifiers and one or more parameter values, wherein the one or more parameter values are derived from a current state of a set of requirements for authorizing modifications to access credentials. The method further comprises traversing a first event log associated with the user to determine one or more access credential values associated with the respective one or more access credential identifiers based on the one or more parameter values and transmitting, to the authorization server, the one or more access credential values.
