(54) Title: SAFETY SYRINGE

(57) Abstract: There is provided a syringe assembly comprising a first, self contained cylindrical storage means (211) containing a first substance (212) and a second, self contained, cylindrical storage means (213) containing a second substance (214). The second storage means is slidably received by the first storage means and is adapted to pierce a slidable sealing element of the first storage means for mixing of the first and second substances in the first storage means. Axially driving the sealing element of the first storage means effects ejection of the resulting mixed substance from the syringe for delivery to a patient. There is also disclosed a syringe assembly with a safety sheath for covering a needle of the syringe when in an extended position and which is slidable from the extended position to a retracted position to expose the needle for use.
