

APPLICATION WINDOW DIVIDER CONTROL FOR WINDOW LAYOUT MANAGEMENT

ABSTRACT

5 An application window divider control is shared by a first application window and a
second application window in a user interface. Based on a received directional
instruction that moves the application window divider control along an axis of the
user interface, placement of the first application window and the second application
10 window may be positioned across a range of consistently spaced points along an axis
of the user interface. Placement adjustment can also impact other application
windows in the user interface. The application window divider control may also
snap to provide “magnetic” points along the axis when certain conditions are
satisfied.
