(54) Title: SYSTEM FOR REAL-TIME FACT-CHECKING OF MULTIMEDIA CONTENT

FIG. 1

(57) Abstract: Using a machine learning model query on received content, one or more statements in the content that meet one or more candidate criteria for correctness verification are automatically identified. For at least one statement of the identified one or more statements, a machine learning model is used to assess correctness of the at least one statement including by searching resources associated with the at least one statement to determine a search result and evaluating the search result. A revision of at least one statement assessed to be incorrect in the identified one or more statements is automatically determined. In some embodiments, a bias report is generated, wherein the bias report compares two or more resources identified by the search result and used to assess the correctness of the at least one statement.
