

CODING METHOD AND APPARATUS, DECODING METHOD AND APPARATUS, AND DEVICE AND STORAGE MEDIUM

ABSTRACT

Disclosed in the present application are a coding method and apparatus, a decoding method and apparatus, and a device and a storage medium. The decoding method comprises: acquiring the permission levels of a user and the current processing unit; according to the permission levels of the user and the current processing unit, acquiring a code stream to be parsed of the current processing unit, wherein the code stream is obtained from the current frame code stream information, the current frame code stream information comprises a code stream with the lowest permission level, and at least one code stream, the permission level of which is greater than the lowest permission level; and when the permission level of the user is greater than or equal to the permission level of the current processing unit, the code stream to be parsed is equal to a code stream with the permission of the current processing unit, and a user with a non-lowest permission level can parse the code stream with the lowest permission level and the at least one code stream, the permission level of which is greater than the lowest permission level; and according to the permission level of the user, the permission level of the current processing unit and a corresponding code stream, acquiring an entropy decoder corresponding to the permission level, and parsing the code stream to be parsed, so as to obtain a corresponding reconstructed image block.
