

A VEHICLE WITH A SLOPING STEERING COLUMN

A B S T R A C T

5 The invention relates to a vehicle (10), e.g. of the scooter type, comprising:

- a deck (12);
- tail gear (30) having single contact means (32);
- a steering assembly (16) comprising at least a

10 steering column (18) having a first axis (X1), the first axis and the plane of the support forming a first angle (a1);

- nose gear (22);
- the nose gear being mounted to pivot relative to

15 the deck about a second axis (X2);

- the steering column being arranged in such a manner that pivoting the steering column about the first axis causes the nose gear to pivot about the second axis; and

20 · the first and second axes sloping relative to each other, thereby defining a second angle (a2).

 The invention is characterized by the fact that the first angle (a1) is not variable while the vehicle is in use.
