CONVERTIBLE BABY SAFETY CAR SEAT ASSEMBLYABSTRACT

A convertible baby safety car seat assembly comprising an upper seat
manipulable between an upright state and an extended state, and legs having distal
10 ends with wheels and manipulable between a storage state which is combinable
only with the upright state of the upper seat in a first mode of the seat assembly,
and an operational state allowing the seat assembly to be rolled by means of said
wheels; the extended state of the upper seat being combinable only with the
operational state of the legs in a second mode of the seat assembly, whilst the
15 operational state of the legs and the upright state of the upper seat being also
combinable at least with each other. Alternatively, or in addition, the convertible
baby safety car seat assembly can further comprise at least one of the following
features: seat and legs manipulation mechanism actuatable at locations spaced
from each other along the length of the seat; side protection module detachably
20 attachable to a handle of the seat assembly; a zipper arrangement for detachably
connecting a cover of the seat and a canopy and comprising a canopy zipper and
a cover zipper. The wheels can be detachably attachable to corresponding distal
ends of the legs.
