FIG. 6B

(57) Abstract: A login request initiated by a user at a current page is received. A search within an account table of the current page is made to identify an account record matching the login account name and password. If a result is positive, the user is allowed to login. If the result is negative, a preconfigured account name collection corresponding to the login account name is acquired. The account name collection includes login account names of the user's registered accounts in the member systems. A login account name in a member system to which the current page belongs is searched from the account name collection, and the found login account name is provided to the user. The techniques of the present disclosure prompts a correct login account name to the user, thereby reducing memory burden and assisting the user in implementing a quick login under multi-account management.
