

METHOD TO CREATE THREE DIMENSIONAL IMAGE INSIDE STONE

The Related Art

5 The invention relates to a method for creation of image inside transparent stones.

The invention particularly relates to a method for creation of various figures in three dimensional in inner parts of precious stones and/or accessories used in jewellery.

10 Background of the Related Art

Processing embodiments inside and on various stones have been realized in order to create images from different designs, pictures and figures in inner parts of transparent stones. The said processing is made by means of designs and colouring coating made on the stone in the simplest way. Another embodiment relates to processes conducted inside transparent stones. Processing the inner part of the stone to give image outside is another applied method. The said method has some problems in terms of application. Cutting inner part of the stone brings the risk of damaging the stone. There are always risks such as breaking or weakening of the stone during removal of inner part of the stone. Processing the inner part of the stone is not easy by use of modern processing members either. One of the said applications is disclosed under patent application numbered TR200607117 entitled "process for sculpture processing in stone". The said application discloses a process containing curving the inner part of the stone and removal of it by use of special methods and filling the space by filling material after painting thereof. The steps of process consisting of 3 steps obtaining a space by means of eroding the lower part of the jewellery stone by use of mechanical method as required by the desired architecture, leaving the eroded and spaced shape as it is in the simple manner or painting in colours by appropriate paint, and filling the space areas of the stone of which painting has been completed, by use of a filling material of hardness close to hardness of the stone.

The said art and applications are for forming a two dimensional image in or on the stone. The known technical applications do not allow to create three dimensional image on or in the stone. Upon development of imaging technologies, capability to create three dimensional images has become alternative to two dimensional images not having depth. Creating three-dimensional image on or in the stone enables giving an effect much closer to the real effect of accessories and is one of the factors determining the preference of consumer. In order to create three-dimensional image and depth, gradual curving in the stone outward is conducted and thus 3-dimensional image can be created. Although it is no so close to the real appearance, the depth can be provided. Even it is likely to create this image for one single member, when images of objects independent of each other are, the gradual curving remains inadequate.

In order to eliminate the said disadvantages, it is aimed to produce jewellery accessories having three-dimensional.

Purpose of the Invention

From the current status of the related art, the purpose of the invention is to eliminate the existing disadvantages by means of improvements made in manufacturing methods used for creation of various three-dimensional figures in inner parts of the precious stones and/or accessories used particularly in jewellery.

Another purpose of the invention is to disclose a stone processing method for image details of real like image which are connected to the desired part of any jewellery and decorative properties such as ring, bracelet, necklace, ear-rings, brooch and cuff links. A further purpose of the invention is to enhance visual depth. Another purpose of the invention is to provide visual effect of figures, shapes, pictures, designs closer to real.

Another purpose of the invention is to provide complex figures having different details. A further purpose of the invention is to provide coloured and non-coloured

images. Thus various alternatives in jewellery have been provided. Therefore, process of figures not intended to be applied in jewellery accessories has been provided. Use of foreign material has been prevented by means of providing design on the stone in this way. Thus, decrease in value of jewellery accessories has been prevented.

In order to achieve the said purposes, it is a method for creation of three-dimensional image in transparent stones used as jewellery and accessories in particularly jewellery and precious stones sector.

A preferred embodiment of the invention is a method for creation of three-dimensional image in the said transparent stone and it comprises process steps of curving the inside of the said transparent stone, forming space therein and providing an outer shell, making at least one designing on the surface of the said outer shell facing inside, making at least one transparent fill layer on the surface of the said outer shell facing inward, making at least one designing on the surface of the said filling layer facing inward, repeating one under the other the designing and filling layer designing as per the design on the surface of the said filling layer facing inward, connecting a at least one three-dimensional object to the inward facing surface of the filling layer at the very bottom, and closing the lower part of the stone.

5 Detailed Description of the Invention

The application shown in figures of the invention relates to a manufacturing method used for creation of various figures in three dimensional in inner parts of precious stones and/or accessories used in jewellery.

The manufacturing processes of the method to form three-dimensional image inside the transparent stone (1) shown in Figures -1a,1b,1c and 1d are as follows.

The manufacturing process comprises process steps of curving the inside of the transparent stone (1), forming space therein and providing an outer shell (1.1),
 5 making at least one designing on the surface of the said outer shell (1.1) facing inside, making at least one transparent filling layer (2) on the surface of the said outer shell (1.1) facing inward, making at least one designing on the surface of the said filling layer (2) facing inward, repeating one under the other the designing and filling layer (2) designing as per the design on the surface of the said filling layer (2) facing
 10 inward, connecting one three-dimensional object (5) to the inward facing surface of the filling layer (2) at the very bottom, and closing the lower part of the stone (1) to complete the manufacturing. The three-dimensional object (5) applied to inner part of the space (5.1) can be provided in the convenient different colour and image designs as per the stone (1).

15 The designing process is an engraving (3) formed by means of curving on the inward facing surface of the outer shell (1.1) (Figure 1c). The designing process is a relief (4) formed by means of embossing on the inward facing surface of the outer shell (1.1) Figure 1c).

20 The designing process is an engraving (3) formed by means of curving on the inward facing surface of the filling layer (2). The designing process is a relief (4) formed by means of embossing on the inward facing surface of the filling layer (2). Relief (4) is the painting layer forming thickness and colour.

25 Figure 2a and Figure 2b show a different manufacturing method wherein three-dimensional object (5) of three dimensional image has been provided in the stone (1).

30 The transparent stone (1) shown in Figures-2a, 2b, 2c and 2d, is formed by curving of the inner side thereof, forming space and leaving an outer shell (1.1), making a transparent filling layer (2) on the inner facing surface of the outer shell (1.1) and

connection of a three-dimensional object (5) onto inward facing surface of the filling layer (2). The three-dimensional object (5) is a three-dimensional figure.

5 The three-dimensional object (5) shown in Figures 2d, 2e and 2f can complete the figures located in the stone (1) upon subjecting it to various processes. The process steps of the method shown in Figures 2b and 2f comprises curving of the inner side of the three-dimensional object (5), forming space (5.1), making a filling inner figure (5.2) on the inner surface of the three-dimensional object (5), making the transparent filling layer (2) on the inner surface of the three-dimensional object (5) and
10 connection of three-dimensional object (5) with processed inner part to the inner surface of the outer shell (1.1). When forming figure in the inner part of the three-dimensional object (5), three-dimensional object (5) is designed from transparent material. The space (5.1) is reinforced by means of a filling material and lower surface of the stone (1) is covered. The filling applied to inner part of the space (5.1)
15 can be provided in the convenient different colour and image designs as per the stone (1).

The three-dimensional object (5) shown in Figures 2a and 2e can complete the figures located in the stone (1) upon subjecting it to various processes. The
20 sequence of process steps comprises respectively making a filling outer figure (5.3) on outer surface of the three-dimensional object (5), making a transparent filling layer (2) on the outer surface of the three-dimensional object (5), connection of the three-dimensional object (5) covered on the inner surface of the outer shell (1.1).

25 A method for forming a three-dimensional image inside a transparent stone (1) according to any one of the above claims and it is characterized in that the filling layer (2) is a transparent material which can be processed to create depth.

The steps of the method shown in Figures-1a,1b,1c and 1d
30 After the stone is provided with a space with a desired depth from lower part of the stone (Figure 1b), relief is curved in the formed space onto inner walls. After painting the curved figures and coating agent is applied, new engraving is made as the

second layer on this coating and then painted. A 3-dimensional depth is provided to the architecture and engraving inside the stone by applying the processes several times.

5 The method shown in Figures-1a,1b,1c and 1d comprises 3 steps.

At step 1, the jewellery is emptied by method of mechanical eroding at the convenient size and depth from lower part of the stone (Figures1-b, 2b).

At step 2, a desired object (three-dimensional object (5)) is located inside the stone (Figures 2d, 2e, 2f).

10 At step 3, a transparent filling material (filling layer (2)) appropriate to the colour and features of the stone (1) is filled in the space remaining after location of object (three-dimensional object (5)). (Figure 2c).

Process steps comprises process of the stone (1), curving of the inside as
15 convenient for the figure, painting the inside of the curving appropriate to the figure, and filling the curving in a manner supporting the curving.

The basic application in forming three-dimensional image is to create original image of any figure. A negative figure is formed inside the stone (1). A negative eroding is
20 made in the inner surface of the stone (1). Thus space is provided by eroding. The eroding is preferably performed by hand because of sensitivity. Thus the curving is realized. The limits of the inner volume are removed as much as possible and is used. The inside of the stone (1) is emptied in a manner the outer shell (1.1) remains.

25 In an illustrative application of the invention,

By means of curving from one edge inward of a precious and/or side precious stone (1) for instance, amethyst colour quartz, tourmalines , citrine, topaz aquamarines etc. by use of digging curving tools, the inside thereof is removed in a manner only one thin outer shell (1.1) remains on other edges. After completion of removing the
30 inside by curving, any portrait, scene, religious symbol, word, devil eye symbol, shape, figure, pattern, picture etc. is drawn on the inner surfaces of the stone turned into a lantern by use of any paint and brushes. The painted picture forms the top

coating of the work performed inside the stone. Then the inner surface of the outer shell (1.1) is coloured by dye. A desired image is provided to the inner part by engraving (3) or relief (4). The relief (4) can be provided by painting (Figure 1c). Depth can be provided by applying filling layer (2) as required by the figure details.

5 Filling layers (2) are applied in an order. Integrity is provided by performing engraving (3) on the filling layers (2) or colouring layers. Processing different images and painting (relief (4)) on each filling layer (2) is carried out. Gradual image is provided by means of creating image on each filling layer (2). The filling layers (2) connected to each other are displayed by various shading (Figure-1d).

10

Among examples of figures made are birds flying over each other, flying butterflies, birds on a building and flying birds over a building, a home seen through an open window, imam at reading desk in a mosque, home view through an open window or dragon which can be imaged easily. It can be said that a kind of pictures over each

15 other is made by means of the created images.

By filling the space remaining in the inner part of the stone (1) of which inner part is processed and shaped with layers, the process is completed. Support is provided by mine and a similar stone as three-dimensional object (5) (Figure-2b).

20

The stone (1) to be processed can be transparent or opaque/mat colour as required by the design. The stone (1) material can be different mineral stone, glass. The process can be made to any types of stone (1). Curving technique depending on type of stone can be made by painting and filling technique.

25

In a different application, the figure can be located not in the form of a picture but as a processed material in the stone (1) such as a three-dimensional object (5) without curving. In other words, the figure can be located to lower base of the transparent stone (1) by means of a three-dimensional object (5). Or it can be supplemented with

30 layer inside the stone (1) by processing a part of the figure on the three-dimensional object (5). The three-dimensional object (5) can also be a precious stone. The inner surface of the three-dimensional object (5) can also be processed.

Shaped stone (1) is inserted or fixed into jewellery and used. The products with coloured or non-coloured inside negative sculpture and decorated with stones formed according to the above description is attached to desired part of any jewellery and decorative belongings such as rings, bracelet, necklace, ear-rings, broche, cuff links
5 by use of any fixing and adhering processes.

The invention cannot be limited to the illustrative embodiments given under this section. Alternative embodiments that can be developed by persons skilled in the related art on basis of basic factors covered under scope of protections indicated
10 under claims shall mean violation of the invention.

CLAIMS

1. The invention is a method to form three-dimensional image inside transparent stone (1) and it is characterized in that it comprises process steps of

- forming at least one space (5.1) by curving the inner side of at least one three-dimensional object (5),
- making at least one filling inner figure (5.2) onto inward facing surface of the said three dimensional object (5),
- making at least one transparent filling layer (2) onto inward facing surface of the said three dimensional object (5),
- connecting three-dimensional object (5) having processed inner side onto inward facing surface of an outer shell (1.1) which is formed by carving from the said transparent stone's (1) inner side.

2. The invention is a method to form three-dimensional image inside transparent stone (1) and it is characterized in that it comprises process steps of

- making at least one filling outer figure (5.3) onto outward facing surface of at least one three dimensional object (5),
- making at least one transparent filling layer (2) onto outward facing surface of the said three dimensional object (5),
- connecting the said coated three-dimensional object (5) onto inward facing surface of an outer shell (1.1) which is formed by carving from the said transparent stone's (1) inner side.
