

DATA SYNCHRONIZATION METHODS, APPARATUSES, AND DEVICES

ABSTRACT

The present specification discloses a data synchronization method, apparatus,
5 and device. In the method, an application can determine to-be-queried data, obtain a
version identifier corresponding to the to-be-queried data from a cache, query the
to-be-queried data from a database when it is determined that the version identifier
corresponding to the to-be-queried data is inconsistent with a specified version
10 identifier, and replace the to-be-queried data stored in the cache with the to-be-queried
data obtained from the database.
