

METHOD AND APPARATUS FOR VERIFYING CERTIFICATES AND IDENTITIES

ABSTRACT

The present application discloses a method and an apparatus for verifying
5 certificates and identities. The method includes the following: first, obtaining an
identity certificate image of an object to be verified; then, verifying whether the
identity certificate image comes from the same shooting scene as a first background
image that is collected on site in advance and/or whether the identity certificate image
comes from a physical certificate to obtain a first verification result; simultaneously
10 verifying the authenticity of identity information in the identity certificate image to
obtain a second verification result; and finally, determining an identity verification
result of the object to be verified, based on the first verification result and the second
verification result.
