

# DATA PROCESSING METHOD AND DEVICE

## ABSTRACT

This specification provides a data processing method and device, and relates to the field of data processing technologies. According to the data processing method and device provided in this specification, an entity association field set of a seed dimension table is preset, each entity association field in the entity association field set is used to associate an entity of a to-be-labeled table with an entity of the seed dimension table, an entity association field corresponding to a table field of the to-be-labeled table in the entity association field set of the seed dimension table is determined, labeling information corresponding to data of each row in the to-be-labeled table is determined from the seed dimension table based on the corresponding entity association field, and data of each row in the to-be-labeled table is labeled, so that data holding entity labeling can be automatically performed on data of each row in the to-be-labeled table, and entity identification can be performed on hybrid data from multiple entities.
