

ABSTRACT

The present disclosure relates to an overheating protection method and device of user equipment, the user equipment and a base station. The overheating protection method of the user equipment comprises: when it is determined that the user equipment is overheated as a result of overhigh wireless link configuration, transmitting to the base station a first signaling requesting a cooling configuration and starting a timer with a preset duration; detecting the temperature of the user equipment in the case of timeout of the timer; and performing an operation corresponding to the detection result. According to the technical scheme of the present disclosure, cooling can be achieved by transmitting the signaling requesting the cooling configuration to the base station when the user equipment (UE) is overheated; and the problem of a heavy signaling burden caused by frequent transmission of signalings at any time can be avoided.
