METHODS, APPARATUSES, AND CLIENT DEVICES FOR PROCESSING SERVICE DATA

ABSTRACT

Implementations of the present application disclose methods, apparatuses, and client devices for processing service data. The method includes: determining target data of a service item that is to be processed; querying whether received data associated with the target data exists within a predetermined time period; when a determining result is yes, setting a first to-be-confirmed label for the received data associated with the target data; and displaying a first message confirmation interface, where the first message confirmation interface includes a confirmation message about whether to combine the received data that has the first to-be-confirmed label into the corresponding service item that is to be processed. According to the implementations of the present application, a user can complete a service item that is to be processed, and further, server resources can be released, server processing speed can be accelerated, and user experience can be improved.
