

ABSTRACT OF THE DISCLOSURE

MEDIA CONNECT DEVICE AND SYSTEM USING THE SAME

Provided a media connect device which serves as a medium between a media player and an audio device, controls the media player in response to a user's manipulation of the audio device, performs USB-packet processing on an audio signal reproduced by the media player, and provide the audio signal packets to the audio device such that sound can be outputted from the audio device. Through the media connect device, an audio device having a USB host interface can be connected to an existing media player without the exterior being modified. Further, even in a case of DRM contents, a user can enjoy songs, which have been previously purchased, without a separate software being supported or repurchased.
