(54) Title: A CONNECTOR

(57) Abstract: A connector for carrying a cable at a location where said cable is intended to be crossed by another electrical cable. The connector has a first connecting portion adapted to be connected to a first section of conduit for carrying said cable; a second connecting portion adapted to be connected to a second section of conduit for carrying said cable; and a cross-over portion intermediate said first and second connecting portions, said cross-over portion being shaped so as to be flatter relative to said sections of conduit at the location where said cable is intended to be crossed by said another cable while having an internal cross-sectional area sufficient to prevent said cable from overheating. The connector has a lower profile at the crossing point, while still allowing for effective heat dispersion from the cable.
