

ABSTRACT

Embodiments of the present invention relate to a data transmission method and apparatus, and a communication device. The method comprises: generating a plurality of first data frames based on the same type of data content, wherein the plurality of first data frames have the same traffic identifier (TID), and the plurality of first data frames having the same TID have the same access media priority in a plurality of transmission connections; and using the plurality of transmission connections to send the plurality of first data frames having the same TID.
