CLAIMS

1. A refillable container, comprising:

an inner container, which is configured to store a content therein, wherein the inner container can be replaced when the content is used up;

a support member configured to support the inner container in an upright posture by holding a bottom of the inner container; and

a cover having a tubular shape, which is fitted, from above the inner container, to an outer periphery of the inner container supported on the support member so as to accommodate the inner container therein, and is fitted to the support member,

the support member including:

a support base portion including a bottom plate portion and a tubular leg portion projecting from the bottom plate portion to define a raised bottom; and

a support frame portion, which is provided on an upper surface of the bottom plate portion of the support base portion, wherein the support frame portion is configured to support the bottom of the inner container,

the support base portion including a seat step portion on which an opening end of the cover fitted to the support member is seated,

wherein the cover is made of hard plastic, and the support member is made of soft plastic.

2. The refillable container according to claim 1, wherein the support member includes a seat projecting portion formed on a portion of an outer periphery of the tubular leg portion of the support base portion exposed from the cover fitted to the support member.

3. The refillable container according to claim 2, wherein the seat projecting portion formed on the outer periphery of the tubular leg portion of the support base portion is formed at each of positions opposed to each other across substantially a center of the tubular leg portion.

4. The refillable container according to claim 1, wherein the cover includes a cutout portion formed in a portion of an opening end of a tubular wall portion of the cover.
