

FALLING AND DEATH LEAP DEFENSE ROTATING CYLINDER

SYSTEM

ABSTRACT

5 The present disclosure relates to a falling and death leap defense rotating cylinder system, including a supporter; a rotator that is rotatably installed in the supporter, and that inhibits a death leap of a death leap attempter by rotating when grasped by the death leap attempter; and a visible unit that forms a cutting edge, and that is
10 detachably installed in any one or more of the supporter and the rotator.

 According to the present disclosure, by the visible unit detachably installed in the supporter or the rotator, a falling and death leap of a death leap attempter may be inhibited more effectively.
