

A LOCK ASSEMBLY

Abstract

5 Described herein is a lock assembly comprising a first lock couplable to a case defining an opening and a second lock couplable to a door comprising a strike structure. Wherein when the door is positioned from an open to a closed position, a first lock and a second lock are inter-disposed for engaging a first joint portion with a second joint portion such that displacing the second joint portion will displace the first joint portion to thereby displace a latch from an unlock to a lock position to engage with the strike structure to consequently lock the door in the closed position.
