Switching device withdrawable part for a switchgear assembly having auxiliary disconnection contacts

A switching device withdrawable part (1) for a switchgear assembly has an operating apparatus (16) for auxiliary disconnection contacts (8). A slide (15) which is provided with a contact unit (14) can be moved by means of a slotted-link arrangement (31), which has a slotted-link body (32) with a worm gear (40) in which a control pin (36) on a shaft (34) engages. One section (40) of the worm gear (33) is formed with a finer pitch and allows the auxiliary disconnection contacts (8) to be closed with little force being exerted when the shaft (34) is operated.
