

ABSTRACT

The embodiments of the present disclosure provide a face identification method and apparatus, where the method includes: determining a target facial image sequence for a target face, wherein the target facial image sequence comprises multiple facial region images for the target face; performing face identification on at least one facial region image in the target facial image sequence, and determining, based on a confidence level of a face identification result of the at least one facial region image, a target facial region image from the target facial image sequence; determining, based on a face identification result of the target facial region image, identity information of the target face. This method improves the identification success rate of the facial region image and reduces the cost of face identification.
