(54) Title: LOW EMISSION POWER GENERATION SYSTEMS AND METHODS

FIG. 1

(57) Abstract: Methods and systems for CO₂ separation for low emission power generation in combined-cycle power plants are provided. One system includes a gas turbine system that stoichiometrically combusts a fuel and an oxidant in the presence of a compressed recycle stream to provide mechanical power and a gaseous exhaust. The compressed recycle stream acts as a diluent to moderate the temperature of the combustion process. A boost compressor can boost the pressure of the gaseous exhaust before being compressed into the compressed recycle stream. A purge stream is tapped off from the compressed recycle stream and directed to a CO₂ separator configured to absorb CO₂ from the purge stream using a potassium carbonate solvent.
