

ABSTRACT

[TASK] To further improve prior art technique.

[SOLUTION] A cartridge includes a first unit including a photosensitive
5 member and a first frame; a second unit including a developing member and a
second frame; a holding portion movable between a first position for holding the
second unit at the separated position and a second position for holding the second
unit at the developing position; a movable member; and an urging portion. the
movable member is movable to a contact force receiving position, a separating
10 force receiving position separating force receiving portion, a first retracted
position, and a second retracted position. The urging portion urges the movable
member placed at the first retracted position in a direction of moving the movable
member toward the contact force receiving position, and urges the movable
member placed at the second retracted position in a direction of moving the
15 movable member toward the separating force receiving position.
