

ABSTRACT

A hair iron comprises a pair of holding members having a heating surface and/or a pressing surface oppositionally on their interior surfaces being joined so that they can be flexibly opened and closed via a joint member at their ends. Furthermore, a slip preventing surface, a fingertip fitting cup and/or a finger trapping loop is formed on the exterior surface of at least one of the holding members at a position where the fingers A straddle the joint member so that a bundle of hair can be ironed flexibly by a simple finger operation.
