ABSTRACT

A suction device, a suction unit, a suction method, and a program are provided. The suction device according to the present invention includes: a suction head; a movement control unit that causes the suction head to move between a first position for suction of an electronic component housed in a recess of a housing member and a second position further separated from
10 the electronic component than the first position; a suction control unit that causes suction of the electronic component to the suction head when the suction head is located at the first position. When located at the first position, the suction head has a contact portion that comes into contact with a first surface on an outer side of a region where the recess in the housing member is
opened.~~An attachment device according to the present invention comprises: an attachment head;~~
15 ~~a movement control unit that moves the attachment head between a first position for attachment of an electronic component housed in a recess of a housing member, and a second position further separated from the electronic component than the first position; an attachment control unit that causes attachment of the electronic component to the attachment head when the attachment head is located at the first position. The attachment head has a contact part that, when located at the~~
20 ~~first position, contacts a first surface on the outer side of a region where the recess in the housing member is opened. By using this such an attachment device, it is possible to, through simple control, suppress damage to an electronic component when the electronic component is attached thereto.~~
