

EYEGLOSS-SHAPED FRAME**ABSTRACT**

[Object] To provide an eyeglass-shaped frame that has both advantages of a temple with a rectangular cross section and advantages of a temple with a circular cross section.

[Solution] The eyeglass-shaped frame having a front part which holds lenses, a face shield, or the like, and temples which are attached to both ends of this front part and provided with an ear hook part, the eyeglass-shaped frame being configured such that: the eyeglass-shaped frame has a first elastic part 11 arranged on a side near the front part F and a second elastic part 12 arranged between the first elastic part 11 and the ear hook part M; the first elastic part 11 permits elastic deformation in a first direction and restricts elastic deformation in a direction different from the first direction; and the second elastic part 12 permits elastic deformation in a second direction intersecting the first direction and restricts elastic deformation in a direction different from the second direction.
