

Abstract

The invention relates to a method performed by test
5 equipment (102) of a wireless communications network test
environment (100) in interaction with an application-
carrying device (104) such as for example a smartphone
having installed a plurality of apps. Monitoring a
wireless communications interface (134) comprises
10 measuring signaling data in a control plane and
application data in a user plane. Cross-layer measurement
data are established based on the measured signaling data
and application data.
