

AGENT FOR REGENERATING TYMPANIC MEMBRANE OR
EXTERNAL AUDITORY CANAL

5

Abstract

10 Provided is a tympanic membrane or ear canal regeneration
agent comprising a combination of a gelatin sponge that
carries basic fibroblast growth factor (bFGF) and a covering
material. The covering material is used not only to fix the
gelatin sponge to the affected portion, but also for the
15 purpose of preventing drying and infections to provide a
culturing environment that is favorable for regenerating
tissue isolated from the outside. To promote tissue
regeneration, the margin of the tympanic membrane or ear canal
defect is preferably freshened in advance.
