

Abstract of the Disclosure

A bottle cleaner includes a housing defining a chamber therein. A support frame is disposed within the housing to support one or more bottles. A base is disposed below the housing. A bottom liner is at least partially received within the housing. The bottom liner defines a plurality of openings and a fluid reservoir. At least one pump is disposed within the base to pump liquid from within the fluid reservoir to one or more spray jets for cleaning the bottles. Further, a blower and heater are disposed within the base. The blower discharges air into the chamber through the plurality of openings to dry the bottles. A heater element produces steam which aids in steam sterilization functionality.
