ABSTRACT

Implementations of the present application provide methods and devices for linking to an account and providing service processing. In the method, after receiving a linking request sent by a user terminal device, an uncertified server can return to the terminal device a predetermined instruction that enables the terminal device to access a certified server. Based on the predetermined instruction, the terminal device can send a real service account of a user used for service processing, so the certified server can generate a virtual service account corresponding to the real service account, and return the virtual service account to the user terminal device. After receiving the virtual service account sent by the user terminal device, the uncertified server can link the virtual service account to a user account that is registered by the user with the uncertified server. It can be seen from the previously described method that, when the uncertified server performs service processing, the user does not need to enter the real service account used for service processing each time, thereby reducing the complexity of service processing for the user and bringing convenience to the user during service processing.
