

ABSTRACT

[Object] To provide a double eyelid forming liquid applicator which allows for performing a series of processes of forming a double eyelid crease with a single integrally formed device and is capable of improving operability.

[Solution] A double eyelid forming liquid applicator includes a stem 10 having a distal end 10a formed of a spherical surface and a grip 40 connected to a proximal portion 13 of the stem, wherein the stem includes an operating portion 11 disposed at a distal portion which includes the distal end of the stem so that a surface of the stem is directly brought into contact with the eyelid, and an impregnation portion 12 which is disposed on the outer peripheral surface of the stem located on the side of the proximal end relative to the operating portion and is configured to be impregnated with a double eyelid forming liquid for applying the liquid to the eyelid, and the stem located on the side of the distal end relative to the proximal portion has flexibility to elastically bend when the impregnation portion is pressed against the eyelid.
