

4. Abstract of the Hybrid cloud architecture for financial technology application

A flexible and reliable hybrid cloud architecture which integrates between public cloud and On premise networks for financial applications between the user, merchant, financial institutions and payment service providers. The architecture segregates the basic and confidential information and the appropriate information is stored in public cloud and data centers. The architecture sends alerts via SMS or emails to the users. The architecture updates the financial institutions and payment service providers on the performance/non-performance of applications based in the cloud.
