

5

Thiazole-Derivatives

10

The present invention is concerned with novel thiazole derivatives. The derivatives inhibit the binding of adhesive proteins to the surface of different types of cell by influencing cell-cell and cell-matrix interactions.

15 The present invention is concerned especially with thiazole derivatives of formula (I)

20 wherein

R¹ isR² is

25

R³ is hydrogen, alkyl, cycloalkyl, aryl, aralkyl, heteroaryl, carboxy, alkyl-O-CO- or aralkyl-O-CO-;

R⁴ is hydrogen, alkyl, cycloalkyl, aryl or heteroaryl;

R⁵ and R⁶ independently of one another are hydrogen, alkyl, cycloalkyl or heteroaryl;

Wb/19.07.99

R^7 and R^8 independently of one another are hydrogen, alkyl, cycloalkyl or heteroaryl or R^7 and R^8 together with the N atoms to which they are attached form a 5- to 8-membered heterocyclic ring which can carry one or more alkyl substituents;

R^9 is hydrogen, alkyl or cycloalkyl;

5 R^{10} is hydrogen, aryl, aralkyl, heteroaryl, heterocyclalkyl, carboxyalkyl, alkyl, cycloalkyl, alkyl-O-CO-, aralkyl-O-CO-, alkyl-CO-, alkylsulphonyl, arylsulphonyl or heteroarylsulphonyl;

A is oxygen, sulphur, -CH=CH-

10 a to f are zero or whole positive integers, with a being zero to 2; b being zero to 4; c and d being zero or 1, with the proviso that c and d are not both simultaneously zero; e is zero to 5, with the proviso that e is other than zero when d is zero and e is zero to 3 when A is equal to -CH=CH-; and f is zero to 3, with the proviso that f is not zero when A is oxygen, sulphur or

15

and their pharmaceutically usable salts and esters.

The compounds of formula I and their pharmaceutically usable salts and esters are
 20 novel and have valuable pharmacological properties. In particular, they inhibit the binding of adhesive proteins such as fibrinogen, vitronectin, von Willebrand factor, fibronectin, thrombospondin and osteopontin to the vitronectin receptors (such as e.g. $\alpha_v\beta_3$, $\alpha_v\beta_5$, $\alpha_v\beta_6$, $\alpha_v\beta_8$, etc.) on the surface on different types of cell. The said compounds therefore influence cell-cell and cell-matrix interactions and can be used in
 25 the treatment and prophylaxis of illnesses which are based on a malfunction of the binding of adhesive proteins to vitronectin receptors. In particular, they can be used as vitronectin receptor antagonists in the prophylaxis or treatment of neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis,
 30 kidney failure as well as infections caused by viruses, bacteria or fungi.

Objects of the present invention are the compounds of formula I and their aforementioned salts and esters per se and their use as therapeutically active substances, a process for the manufacture of the said compounds, intermediates, pharmaceutical compositions, medicaments which contain the said compounds, their salts or esters, the use of the said compounds, solvates and salts for the prophylaxis and/or therapy of illnesses, especially in the treatment or prophylaxis of, for example, neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis, kidney failure as well as infections caused by viruses, bacteria or fungi, and the use of the said compounds and salts for the production of medicaments for the treatment or prophylaxis of, for example, neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis, kidney failure as well as infections caused by viruses, bacteria or fungi.

15

In the present description the term "alkyl", alone or in combination, signifies a straight-chain or branched-chain alkyl group with 1 to 8 carbon atoms, preferably a straight-chain or branched-chain alkyl group with 1-4 carbon atoms. Examples of straight-chain and branched C₁-C₈ alkyl groups are methyl, ethyl, propyl, isopropyl, butyl, isobutyl, tert.-butyl, the isomeric pentyls, the isomeric hexyls, the isomeric heptyls and the isomeric octyls, preferably methyl, ethyl, isopropyl and tert.butyl.

20

The term "cycloalkyl", alone or in combination, signifies a cycloalkyl ring with 3 to 8 carbon atoms and preferably a cycloalkyl ring with 3 to 6 carbon atoms. Examples of C₃-C₈ cycloalkyl are cyclopropyl, methyl-cyclopropyl, dimethyl-cyclopropyl, cyclobutyl, methyl-cyclobutyl, cyclopentyl, methyl-cyclopentyl, cyclohexyl, methyl-cyclohexyl; dimethyl-cyclohexyl, cycloheptyl and cyclooctyl, preferably cyclopentyl and particularly cyclopentyl.

25

The term "alkoxy", alone or in combination, signifies an alkyl ether group in which the term "alkyl" has the previously given significance, such as methoxy, ethoxy, n-propoxy, isopropoxy, n-butoxy, isobutoxy, sec.butoxy and tert.butoxy, preferably methoxy and ethoxy.

30

The term "aryl", alone or in combination, signifies a phenyl or naphthyl group which optionally carries one or more substituents each independently selected from alkyl, alkoxy, halogen, carboxy, alkoxycarbonyl, aminocarbonyl, hydroxy, amino, nitro and the like, such as phenyl, p-tolyl, 4-methoxyphenyl, 4-tert. butoxyphenyl, 4-fluorophenyl, 2-chlorophenyl, 3-chlorophenyl, 4-chlorophenyl, 4-hydroxyphenyl, 1-naphthyl, 2-naphthyl. Alkoxy-phenyls and chlorophenyls are preferred, especially phenyl and ortho-, meta- and para-monochlorophenyls, specially para- and meta-chlorophenyl and para- and meta-methoxy-phenyl. Phenyl is particularly preferred.

10 The term "aryloxy", alone or in combination, signifies a group of the formula -O-aryl in which the term "aryl" has the previously given significance.

The term "aralkyl", alone or in combination, signifies an alkyl or cycloalkyl group as previously defined in which one hydrogen atom is replaced by an aryl group as previously defined, such as, for example, benzyl, 2-phenylethyl and the like, preferably benzyl.

The term "aralkoxy", alone or in combination, signifies an aralkyl group as previously defined in which one hydrogen atom of the alkyl part is replaced by an oxygen atom which carried the free valency. Benzyloxy is preferred.

The term "arylene", alone or in combination, signifies a phenylene or a naphthylene group which optionally carries one or more substituents selected from alkyl, cycloalkyl, halogen, hydroxy, amino, nitro, aryloxy, aralkoxy, alkoxy-alkoxy and preferably alkoxy, carboxy and -CO-O-CH₂-CO-O-alkyl. Examples are ortho-, meta- or para- phenylene, the tolylenes, the methoxyphenylenes, the tert. butoxyphenylenes, the fluorophenylenes, the chlorophenylenes, the hydroxyphenylenes, the naphthylenes the benzyloxyphenylenes etc. Preferred are meta- and para-phenylenes, with the substituents of the phenylene previously given by the definition of R² standing meta or para to one another and whereby in addition one or more substituents selected from alkyl, cycloalkyl, halogen, hydroxy, amino, aryloxy and alkoxy-alkoxy and preferably alkoxy, carboxy and -CO-O-CH₂-CO-O-alkyl can be present on the arylene ring. Especially preferred are meta- and para-phenylene which carry one of the previously named substituents on the phenylene ring and in this case there are most particularly preferred the meta- and para-phenylenes which

carry methoxy, carboxy or $-\text{CO}-\text{O}-\text{CH}_2-\text{CO}-\text{O}-\text{ethyl}$ on the phenylene ring. Meta- and para-phenylene are particularly preferred.

The term "heterocyclyl", alone or in combination, signifies a saturated, partially
5 unsaturated or aromatic 5 to 10 membered heterocycle which contains one or more hetero
atoms selected from nitrogen, oxygen and sulphur. If desired, it can be substituted on one
or more carbon atoms by halogen, alkyl, alkoxy, oxo etc. and/or on a secondary nitrogen
atom (i.e. $-\text{NH}-$) by alkyl, cycloalkyl, aralkoxycarbonyl, alkanoyl, phenyl or phenylalkyl or
on a tertiary nitrogen atom (i.e. $=\text{N}-$) by oxido, halogen, alkyl, cycloalkyl and alkoxy are
10 preferred. Examples of such heterocyclyl groups are pyrrolidinyl, piperidinyl, piperazinyl,
morpholinyl, thiomorpholinyl, pyrrolyl, imidazolyl (e.g. imidazol-4-yl, 1-benzyloxy-
carbonylimidazol-4-yl), pyrazolyl, pyridyl, pyrazinyl, pyrimidinyl, hexahydropyrimidinyl,
furyl, thienyl, thiazolyl, oxazolyl, thiazolyl, indolyl (e.g. 2-indolyl), quinolyl (e.g. 2-
quinolyl, 3-quinolyl, 1-oxido-2-quinolyl), isoquinolyl (e.g. 1-isoquinolyl, 3-isoquinolyl),
15 tetrahydroquinolyl (e.g. 1,2,3,4-tetrahydro-2-quinolyl), 1,2,3,4-tetrahydroisoquinolyl (e.g.
1,2,3,4-tetrahydro-1-oxo-isoquinolyl) and quinoxalinyl. Preferred are 5- or 6-membered
rings, especially piperidyl and pyridyl.

The term "heteroaryl", alone or in combination, signifies the aromatic compounds
20 which fall under the definition of "heterocyclyl" and which can carry the substituents
described there. Preferred are 5- and 6-membered rings, especially pyridyl.

The term "amino", alone or in combination, signifies a primary, secondary or
tertiary amino group bonded via the nitrogen atom, with the secondary amino group
25 carrying an alkyl or cycloalkyl substituent and the tertiary amino group carrying two
similar or different alkyl or cycloalkyl substituents or the two nitrogen substituents
together forming a ring, such as, for example, $-\text{NH}_2$, methylamino, ethylamino,
dimethylamino, diethylamino, methyl-ethylamino, pyrrolidin-1-yl or piperidino etc.,
preferably amino, dimethylamino and diethylamino, particularly primary amino.

30

The term "halogen" signifies fluorine, chlorine, bromine or iodine, preferably
chlorine.

The term "alkyl-O-CO-" signifies an alkyl ester group in which alkyl is as previously
35 defined. In this case the methyl ester, ethyl ester, the isomeric propyl ester and the isomeric

butyl ester groups are preferred. The methyl ester and ethyl ester groups are especially preferred.

The term "aralkyl-O-CO-" signifies an aralkyl ester group in which aralkyl is as previously defined. In this case the benzyl ester group is preferred.

The term "heterocyclalkyl" signifies an alkyl group as previously defined in which a hydrogen atom has been replaced by a heterocycl group. Pyridylmethyl, 1-pyridylethyl and 2-pyridylethyl are examples of such heterocyclalkyls.

10

The term "alkylsulphonyl" signifies a

group in which alkyl is as previously defined. Preferred "alkylsulphonyls" are methylsulphonyl, ethylsulphonyl, the isomeric propylsulphonyls and the isomeric butylsulphonyls.

The term "arylsulphonyl" signifies a

20

group in which aryl is as previously defined. Preferred arylsulphonyls are phenylsulphonyl, 1-naphthylsulphonyl, 2-naphthylsulphonyl and 2-mesitylenesulphonyl.

25

The term "heteroarylsulphonyl" signifies a

group in which heteroaryl is as previously defined. Preferred heteroarylsulphonyls are 2-thiophenesulphonyl and 3,5-dimethylisoxazole-4-sulphonyl.

The term "alkyl-CO-" signifies an alkylcarbonyl group in which alkyl is as previously defined. Methyl- and ethylcarbonyl are preferred examples.

Examples of physiologically usable salts of the compounds of formula I are salts with physiologically compatible mineral acids such as sulphuric acid, phosphoric acid or preferably hydrochloric acid; or with organic acids such as methanesulphonic acid, acetic acid, trifluoroacetic acid, citric acid, fumaric acid, maleic acid, tartaric acid, succinic acid or salicylic acid. The compounds of formula I having a free carboxy group can also form salts with physiologically compatible bases. Examples of such salts are alkali metal, alkaline earth metal, ammonium and alkylammonium salts such as the Na, K, Ca or tetramethylammonium salt. The compounds of formula I can also exist in the form of zwitterions.

In the nomenclature used in the present description the ring atoms of the thiazole ring are numbered as follows:

with substituent R^1 being bonded to position 2 and the substituents R^2 being bonded to position 4 and R^3 being bonded to position 5:

or R^2 being bonded to position 5 and R^3 being bonded to position 4 of the thiazole ring:

The invention expressly includes pharmaceutically suitable derivatives of the compounds of formula I. For example, the COOH groups in R² can be esterified.

5 Examples of suitable esters are the alkyl and aralkyl esters. Preferred esters are the methyl, ethyl, propyl, butyl, benzyl and (R/S)-1-((isopropoxy-carbonyl)-oxy)-ethyl ester. The ethyl esters and the isomeric butyl esters are especially preferred.

10 The compounds of formula I can also be solvated, e.g. hydrated. The hydration can be effected in the course of the manufacturing process or can take place e.g. as a consequence of hygroscopic properties of an initially anhydrous compound of formula I (hydration).

15 The compounds of formula I can contain several asymmetric centres and can exist in the form of optically pure enantiomers, mixtures of enantiomers such as, for example, racemates, optically pure diastereoisomers, mixtures of diastereoisomers, diastereoisomeric racemates or mixtures of diastereoisomeric racemates.

20 Examples of preferred compounds of formula (I) are those in which R² is

Also preferred are the above compounds of formula (I) in which R² is

25 Likewise preferred compounds of formula (I) are those in which R² is

To the preferred compounds there furthermore belong those in which R² is

5

Compounds of formula (I) in which A is oxygen or -CH=CH- are preferred. Oxygen is especially preferred.

10 To the preferred compounds described above there furthermore belong those in which R¹ is

15 Furthermore, preferred compounds of formula (I) are those in which arylene is phenylene or substituted phenylene, with the substituted phenylene carrying one or more, preferably one, aralkoxy, halogen, alkoxy-alkoxy and especially alkoxy, carboxy or -CO-O-CH₂-CO-O-alkyl substituent.

20 Specially preferred are the above compounds of formula (I) in which arylene is meta- or para-phenylene or substituted meta- or para-phenylene, with the substituents of the phenylene previously given by the definition of R² standing meta- or para- to one another and with the substituted phenylene carrying an additional substituent selected from the group of alkoxy, carboxy or -CO-O-CH₂-CO-O-alkyl and particularly from the
 25 group of methoxy, carboxy and -CO-O-CH₂-CO-O-ethyl on the ring. Quite particularly preferred are the above compounds of formula (I) in which arylene is unsubstituted phenylene and especially unsubstituted meta- or para-phenylene.

A group of preferred compounds of formula (I) comprises those in which R^3 is hydrogen, alkyl, cycloalkyl or phenyl. Of these, especially preferred compounds are those in which R^3 is hydrogen or alkyl.

5 A further group of preferred compounds of formula (I) comprises those in which R^4 is hydrogen, alkyl, cycloalkyl or phenyl and particularly preferred are those in which R^4 is hydrogen or phenyl.

Also preferred are the above compounds of formula (I) in which R^5 , R^6 , R^7 and R^8 are hydrogen or R^5 and R^6 are both hydrogen and R^7 and R^8 together with the N atoms to which they are attached form a 5- to 6-membered ring. Of these there are especially preferred those in which R^5 , R^6 , R^7 and R^8 are hydrogen.

A further group of preferred compounds of formula (I) comprises those in which R^9 is hydrogen or cycloalkyl. Those in which R^9 is hydrogen are particularly preferred.

The preferred compounds of formula (I) in which A is

$\begin{array}{c} R^{10} \\ | \\ -N- \end{array}$ are those in which R^{10} is alkyl or cycloalkyl and especially those in which R^{10} is hydrogen. Particularly preferred are these compounds in which R^{10} is phenyl.

Preferred compounds are compounds of formula (I) in which R^2 is bonded to position 4 and R^3 is bonded to position 5 of the thiazole ring. Of these there are especially preferred those in which R^2 is bonded to position 4 and R^3 is bonded to position 5 of the thiazole ring and R^1 is

Likewise preferred are compounds of formula (I) in which a is equal to 1. Those in which a is zero are especially preferred.

Also preferred are compounds of formula (I) in which b is zero to 2 and especially those in which b is equal to 1.

Furthermore, compounds of formula (I) in which e is zero to 4 are preferred. Those in which e is equal to 3 and d is equal to zero are especially preferred.

5 Likewise especially preferred compounds in accordance with formula (I) are those in which e is equal to zero and d is equal to 1.

A further group of preferred compounds of formula (I) embraces those in which f is equal to 1 and A is equal to oxygen, sulphur or

10 $\begin{array}{c} R^{10} \\ | \\ -N- \end{array}$ and particularly in which A is oxygen.

Likewise preferred are compounds of formula (I) in which f is equal to zero and A is -CH=CH-.

15 Furthermore, there are preferred compounds of formula (I) in which A is

$\begin{array}{c} R^{10} \\ | \\ -N- \end{array}$, R^{10} is phenyl, c is 1 and e is zero.

Examples of preferred compounds of formula I are:

20

Butyl {3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-propoxy}-acetate;
[3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-propoxy]-acetic acid
hydrochloride;

25

ethyl {4-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy}-acetate;
[4-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy]-acetic acid
hydrochloride;

30

butyl {3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy}-acetate;
[3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy]-acetic acid;
ethyl {4-[(2-guanidino-thiazole-4-carbonyl)-amino]-phenoxy}-acetate;
[4-[(2-guanidino-thiazole-4-carbonyl)-amino]-phenoxy]-acetic acid
hydrochloride;
ethyl {4-[(2-guanidino-thiazole-5-carbonyl)-amino]-phenoxy}-acetate;

[4-[(2-guanidino-thiazole-5-carbonyl)-amino]-phenoxy]-acetic acid
hydrochloride;

- ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy)-acetate;
[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy]-acetic acid;
5 ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-
acetate;
(4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-acetic
acid;
ethoxycarbonylmethyl 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-
10 ethoxycarbonylmethoxy-benzoate;
5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-carboxymethoxy-benzoic
acid;
ethyl (E)-3-[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-
acrylate;
15 (E)-3-[4-[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-acrylic acid;
and
methyl [(4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl)-phenyl-
amino]-acetate.

20 The following compounds are especially preferred examples of these:

- Ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy)-acetate;
[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy]-acetic acid;
ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-
25 acetate;
(4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-acetic
acid;
ethoxycarbonylmethyl 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-
ethoxycarbonylmethoxy-benzoate;
30 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-carboxymethoxy-benzoic
acid;
ethyl (E)-3-[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-
acrylate;
(E)-3-[4-[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-acrylic acid.

Processes for the manufacture of compounds of formula I are also an object of the invention. The processes are based in each case on the reaction of a thiazole derivative, which represents the basic thiazole structure, with a reactive reagent, which represents the substituent R² or a reactive component and/or derivative thereof.

5

The following routes can be set out for the preparation of the corresponding basic thiazole structure, with the substituents and indices used in the following Schemes having the significances given above unless indicated otherwise.

10

Suitable basic thiazole structures can be prepared, for example, by the method presented in Scheme 1a. In this, an α -bromo-ketone of formula VII, such as ethyl pyruvate, is reacted in a solvent, such as ethanol, with a thiourea derivative of formula VIII, such as 2-imino-4-thiobiuret, at elevated temperature (J. Med. Chem. 1991, 34, 914). A subsequent saponification of the ester group by means of a base, such as aqueous NaOH or KOH, yields a thiazole-4-carboxylic acid derivative of type X (Scheme 1a).

15

In one process variant there is used an optionally substituted thiourea of formula IX, which, after cyclization to the thiazole, is reacted with an isocyanate, such as benzyl isocyanate, in a solvent, such as DMF, at room temperature, followed by a saponification of the ester as described above.

20

Scheme 1a

α -Halo-ketones are used in a further preparative process (Scheme 1b), which
 5 analogously to the process described above yields thiazole-5-carboxylic acid derivatives of
 type XIII (Farmaco 1989, 44, 1011). The α -halo-ketones of formula XII are prepared
 from the corresponding β -ketoesters (formula XI), such as ethyl butyrylacetate, ethyl
 pivaloylacetate, etc., by halogenation with e.g. bromine in a solvent, such as water,
 conveniently at a temperature of 0-5°C (J. Chem. Soc. Perkin I, 1982, 162).

Scheme 1b

In another variant (Scheme 1c), the basic thiazole structure is synthesized by
 5 reaction of an N-protected amino acid thioamide, optionally substituted at the amino
 nitrogen, such as N-Boc-glycine thioamide, with an α -halo-ketone of formula VII or XIIb.
 A subsequent saponification of the ester group by means of a base, as described under
 Scheme 1a, yields thiazolecarboxylic acid derivatives of formula XIV. After removal of the
 protecting group these can be further modified, for example in accordance with Scheme 7.

10

When a residue $((\text{CH}_2)_e\text{-NH-(protecting group)})$ is used in place of the COOR^{01}
 residue in compound XIb or XII, then the aminothiazole derivatives corresponding to
 XIII can be obtained. The same also applies to Scheme 1a.

Scheme 1c

In an additional process variant (Scheme 1d), a substituted benzaldehyde, such as 3-nitrobenzaldehyde, or methyl 3-formylbenzoate, is converted with a nitroalkane, such as nitroethane, in a suitable solvent, such as acetic acid, with the addition of ammonium acetate, conveniently at elevated temperature, such as reflux temperature, into the corresponding nitro-olefin (Org. Synth. Coll. IV, 573 or Synthesis 1994, 258). This is epoxidized by means of an oxidation agent, such as hydrogen peroxide, in a suitable solvent, such as water, with the addition of aqueous sodium hydroxide solution to give a nitroepoxide of formula XV (Synthesis 1976, 53). The reaction of such a nitroepoxide with a thiourea derivative, such as 2-imino-4-thiobiuret, at elevated temperature, such as reflux temperature, yields arylthiazoles of formula XVI.

By using an alternative thiourea derivative in the above reaction and subsequent reaction with an isocyanate, such as benzyl isocyanate, in a solvent, such as DMF, at room temperature there are obtained arylthiazoles of formula XVII into which subsequently an additional substituent R^5 can be introduced by conventional methods.

Scheme 1d

$\text{Y} = -\text{NO}_2,$
 $-\text{COOR}^{03},$
 $-(\text{CH}_2)_c-\text{NH}-(\text{protecting group, e.g. Boc or Cbz})$
 $\text{R}^{03} = \text{alkyl}$

or

When using

in place of compound XV in Scheme 1d there is obtained the compound corresponding to XVI and XVII, but with the arylene residue being bonded to position 4 and R³ being bonded to position 5 of the thiazole ring.

5 In order to prepare compounds analogous to XVI and XVII, with a being other than zero in accordance with formula (I), the thioamide used as the starting material in Scheme 1c can, for example, be used in place of the thiourea derivative used in Scheme 1d.

The basic thiazole structures obtainable in accordance with the above processes are converted in a subsequent reaction with reactive component and/or reactive derivative of the R² substituent to give a compound of general formula I in one or more reaction steps.

10 When c is equal to 1, i.e. an amide bond is present on the thiazole structure, a corresponding thiazolecarboxylic acid can be reacted according to known methods with a corresponding amine to give a compound of formula I. In principle, the following route can be pursued:

15 In the following process variant (Scheme 2), the desired thiazole I is manufactured by coupling a thiazolecarboxylic acid of formula XVIII with an amine of formula XIX by means of BOP, HBTU or CDMT and subsequently hydrolyzing the ester function. In this connection see also Z.J. Kaminski, Synthesis, 1987, 917.

Scheme 2

Where A is equal to -NH-, then this amine function has to be protected with usual protecting groups, e.g. Boc.

In particular, a thiazolecarboxylic acid XVIII is coupled with an amine of formula XIX by means of a conventional coupling reagent, such as HBTU, CDMT, etc., in the presence of a base, such as N-methylmorpholine, in a solvent, such as DMF or THF. The free compounds of formula I are formed in a subsequent ester cleavage by means of strong acid, such as trifluoroacetic acid in methylene chloride or aqueous hydrochloric acid, or by means of a strong base, such as NaOH.

Alternatively, the above compounds of general formula I can also be obtained by reaction of a reactive partial component of the amine XIX and subsequent addition of the still missing substituent component of R².

Where c is equal to zero, i.e. the thiazole ring does not carry an amide bond and d is 1, the following procedure is used for the synthesis of the compounds of formula I:

When e is also equal to zero, the basic thiazole structure is prepared analogously to Scheme 1d, with Y there being equal to -O-benzyl (see Scheme 3).

5

Scheme 3

The benzyl group is cleaved off hydrogenolytically and, where A is oxygen, the resulting alcohol is reacted with the halide of formula XXIII

(XXIII)

Where c is equal to zero, d is equal to 1, e is equal to zero and A is sulphur, the following procedure is used: The thiazole-arylene halide XXIV is reacted with the corresponding thiolate XXV e.g. in the presence of a Cu or Pd catalyst in DMF or DMSO.

5

The halogenated arylene XXIV is prepared according to Scheme 1d, with Y being bromine, chlorine or iodine.

Where c is equal to zero, d is equal to 1, e is other than zero and A is sulphur, the products from Scheme 3 are used. After hydrogenolytic cleavage of the benzyl group (H_2 , Pd/C) the thus-obtained alcohol is converted with e.g. methanesulphonyl chloride or p-toluenesulphonyl chloride into the corresponding mesylate or tosylate. Subsequently, reaction is then with the corresponding thiols or thiolates in the presence of a non-nucleophilic base e.g. diisopropylethylamine.

Where c is equal to zero, d is equal to 1, e is equal to zero and A is equal to $-\text{NR}^{10}-$, the corresponding basic thiazole structures are prepared in accordance with Scheme 1d, with Y being equal to NO_2 . The corresponding amine is obtained after reduction with hydrogen and a Pd/C catalyst or Raney-nickel in alcohol.

Where R^{10} is aralkyl, alkyl, cycloalkyl, heterocyclylalkyl or carboxyalkyl, these are obtained by reductive amination with the corresponding aldehydes in the presence of borohydrides and catalytic hydrogenation (see e.g. G. Verardo et al., Synthesis 1993, 121).

Where R^{10} is aryl or heteroaryl, the basic thiazole structure from Scheme 1d is used, with Y being equal to $-\text{NH}_2$. This is reacted with the corresponding heteroaryl halide or aryl halide (see J. P. Wolfe et al., Tetrahedron Letters, 1997, 38, 6367; S.L. Buchwald et al.,

Tetrahedron Letters, 1997, 38, 6359; S.L. Buchwald et al., J. Org. Chem., 1997, 62, 6066; D. Ma et al., Tetrahedron Asymm., 1998, 9, 1137).

The thus-obtained amines are then reacted with the corresponding halides of the
5 formula

R^{11} = alkyl, aralkyl

10 under the conditions of a nucleophilic substitution reaction. The thus-obtained esters are cleaved under basic conditions, as mentioned in Scheme 1a.

Where R^{10} is acyl or sulphonyl, the following procedure can be used:

15 Where d is zero, a protected amine of the following formula

R^{11} = alkyl, aralkyl

Protecting group: e.g. Boc or Cbz

20 (see e.g. L. Christensen et al., Nucleic Acids Res., 1998, 26, 2735) is acylated at the free nitrogen atom with a carboxylic acid chloride or carboxylic acid anhydride or sulphonated with a sulphonic acid chloride (see e.g. I.S. Weitz et al., J. Org. Chem. 1997, 62, 2527 or P. H. H. Hermkens et al., Tetrahedron, 1988, 44, 1991). After cleavage of the protecting
group the resulting amine can be coupled with a thiazolecarboxylic acid of formula X or
25 XIII according to conventional methods and, after hydrolysis of the ester function, converted into the corresponding derivatives of formula I.

Where d is 1, a compound of the formula

R^{11} = alkyl, aralkyl

5

(see J. Kihlberg et al., Acta Chem. Scand., Ser.B, 1983, B37, 911 and A.G. Katopodis et al., Biochemistry, 1990, 29, 4541) can be acylated or sulphonylated at the free nitrogen atom in the manner described above. The thus-obtained compounds are subsequently reduced to the corresponding amines of the formula

10

R^{10} = acyl, sulphonyl

R^{11} = alkyl, aralkyl

Where R^9 signifies alkyl or cycloalkyl, the thus-obtained amine is reacted with the corresponding aldehyde under the conditions of a reductive amination (procedure for the reductive amination e.g. see the case where c is equal to zero, d is equal to 1, e is equal to zero and A is equal to $-\text{NR}^{10}-$).

15

The corresponding derivatives of formula I can be obtained by coupling these amines with the thiazolecarboxylic acids of formula X or XIII and subsequent hydrolysis of the ester function.

20

Where c is equal to zero, d is equal to 1, e is other than zero and A is equal to $-\text{NR}^{10}-$, the compound corresponding to Scheme 1d with Y equal to O-benzyl is converted by hydrogenation into the corresponding alcohol [and] then reacted with e.g. methane-sulphonyl chloride or paratoluenesulphonyl chloride to give the corresponding mesylate or tosylate. Subsequent reaction is with the corresponding amine components under the conditions of a nucleophilic substitution reaction.

25

The procedure in Scheme 4 is used for the preparation of the thiazole derivatives XXVI of formula I, with c being equal to zero, d being equal to 1, e being equal to zero and A being -CH=CH-:

Scheme 4

5

The corresponding thiazole-arylene bromide or iodide XXIV is converted under the conditions of the Heck reaction in the presence of Pd/C in e.g. DMF at about 80°C to 100°C with the corresponding alkene (see e.g. S. G. Davies et al., J. Chem. Soc. Perkin 1, 1987, 2597).

10

Where c is equal to zero, d is equal to 1, e is 1 to 3 and A is -CH=CH-, the following procedure is used: The procedure as in Scheme 1d is followed using the following aldehyde XXVII:

15

(XXVII)

(Protecting group e.g. benzyl)

The thus-obtained thiazole derivative (XXVIII) is now subsequently processed
 5 further in accordance with Scheme 5. The benzyl protecting group is removed by catalytic
 hydrogenation. The reductively obtained alcohol is finally oxidized to the aldehyde
 according to usual conditions (e.g. Tetrahedron Lett. 1992, 33, 5029).

Scheme 5

1) Protecting group removal
 (e.g. benzyl by catalytic hydrogenation)

2) Oxidation to the aldehyde
 (e.g. Tetrahedron Lett. 1992, 33, 5029)

10

The thus-obtained aldehyde XXIX is reacted in accordance with Scheme 6 under
 Wittig conditions (or a variant thereof) with the phosphonium halide with the formation
 of the double bond. The free acid of the desired compound is obtained by ester cleavage
 15 e.g. LiOH/THF/H₂O.

Scheme 6

- 5 In addition to the processes described above, the substituent R^1 can be varied in the scope of the definitions of general formula I. For example, the Boc protecting group of compound (XIV) can be cleaved off for the preparation of the corresponding compounds of the formulae

The resulting amine is reacted with the corresponding amidating reagent e.g. amidinosulphonic acid to give the corresponding guanidine derivatives (R^7 and R^8 are hydrogen). Where R^7 and R^8 are other than hydrogen, an amidation procedure corresponding to M.A. Poss et al., Tetrahedron Letters, 1992, 33, 5933-36 is chosen.

In a process variant (Scheme 7), a thiazole derivative of formula XXXI can be guanidated (Tet. Lett 29, 3183-86, 1998) with intermediary protection of the acid functions contained in R^2 and R^3 .

Scheme 7

Compound XXXI is reacted with an isocyanate for the manufacture of the corresponding urea derivatives.

Alternatively, the amine XXXI can also be treated with equimolar amounts of phosgene in the presence of a base e.g. triethylamine and this can then be reacted with the corresponding amine of the formula

Where R^5 is other than hydrogen, after cleavage of the Boc protecting group from compound (XIV) alkylation by reductive amination with the corresponding aldehyde is carried out.

Compounds of the type XXXI can be obtained, for example, from compounds XIV by removal of the Boc protecting group under acidic conditions e.g. trifluoroacetic acid.

Alternatively, the thus-obtained amine can be converted stepwise into the corresponding monoalkylamines by reductive amination with the corresponding aldehydes e.g. in the presence of borohydrides or H_2/PdC .

In order to obtain the corresponding heteroaryl derivatives of compound (XIV) there are used thiourea derivatives corresponding to Scheme 1c which are substituted on the nitrogen with heteroaryl. These are reacted with compound (VII) or (XIb).

Where a is equal to zero, the procedure starts from the corresponding basic thiazole compounds of Schemes 1a, 1b and 1d.

The amine XIX used in Scheme 2 can be prepared according to generally known processes. For example, the following procedure can be used when A is oxygen. The ether bond present can be obtained by reaction of a hydroxy function with the corresponding halide. At the same time, other reactive groups such as e.g. the amino function have to be inactivated using known protecting group technology.

Where A is sulphur, the thioether group can be prepared, for example, by reaction of a halide with the corresponding thiolate in DMF or DMSO. The thiolate used is produced from the corresponding thiol by abstraction of a proton by means of a base. In

a variant, the desired thioether compound can be obtained by reaction of a thiolate with the corresponding mesylate or tosylate. This mesylate or tosylate can be obtained, for example, from the corresponding alcohols by reaction with methanesulphonyl chloride or paratoluenesulphonyl chloride.

5

Where A is $-NR^{10}-$, the desired nitrogen-carbon bond can be obtained according to the same principles as previously described (see c equal to zero and A is $-NR^{10}-$).

Where A is $-CH=CH-$, the amine used in Scheme 2 can be obtained in analogy to the previously described procedures (see Scheme 4, Scheme 5 and Scheme 6). Thus, e.g. analogously to Scheme 4 a corresponding aminobromoarylene or aminoiodoarylene can be reacted palladium-catalyzed with the corresponding alkene. In this case the amino group can carry a BOC protecting group. Alternatively, the procedure can start from a corresponding nitrobromoarylene which, after the palladium-catalyzed coupling, is reduced with tin dichloride dihydrate in ethanol with the retention of the double bond. Likewise, the corresponding nitroarylene can be employed analogously to Scheme 5. After oxidation to the aldehyde and after performing the Wittig reaction the nitro group can then be reduced to the amine with tin (II) as described above.

The amine in which d is equal to zero required for Scheme 2 can be prepared starting from the corresponding protected aminoalcohol. After oxidation to the aldehyde (see Scheme 5) the desired amine is then obtained by a Wittig reaction.

The invention likewise embraces intermediates of the formulae

25

and

and their salts, with R^1 , R^3 and a having the previously given significance and R^3 in formula XVIII not being hydrogen or methyl when R^1 is

5

10

Especially preferred intermediates are:

Butyl (3-tert-butoxycarbonylamino-propoxy)-acetate;

butyl (3-amino-propoxy)-acetate hydrochloride;

15 ethoxycarbonylmethyl 5-benzoyloxycarbonylamino-2-ethoxycarbonylmethoxy-benzoate;

ethoxycarbonylmethyl 5-amino-2-ethoxycarbonylmethoxy-benzoate.

Further objects of the invention are the compounds of formula (I) described above for use as therapeutically active substances.

20

Also an object of the invention are compounds of formula (I) described above for the production of medicaments for the prophylaxis and therapy of illnesses which are based on a malfunction of the binding of adhesive proteins to vitronectin receptors.

Likewise an object of the invention are pharmaceutical compositions containing a compound of formula (I) described above and a therapeutically inert carrier. The invention likewise relates to a pharmaceutical composition as previously described which additionally contains one or more compounds of general formula (I) or additionally one
5 or more compounds selected from the group comprising anticoagulants, fibrinolytics as well as medicaments for the prophylaxis and therapy of illnesses which are based on a malfunction of the binding of adhesive proteins to vitronectin receptors.

An object of the invention is also the use of the compounds of formula (I)
10 described above for the production of medicaments for the treatment or prophylaxis of illnesses which are based on a malfunction of the binding of adhesive proteins to vitronectin receptors.

Also an object of the invention is the use of one of the compounds of formula (I)
15 described above for the production of medicaments e.g. for the treatment or prophylaxis of neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis, kidney failure as well as infections caused by viruses, bacteria or fungi.

20 A further object of the invention comprises compounds of formula (I) which are manufacturable in accordance with one of the described processes.

Likewise an object of the invention are methods for the treatment and prophylaxis of illnesses which are based on a malfunction of the binding of adhesive proteins to
25 vitronectin receptors and which comprise the administration of an effective amount of a compound of formula (I).

An object of the invention is further a method for the treatment and prophylaxis of neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic
30 retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis, kidney failure as well as infections caused by viruses, bacteria or fungi, which method comprises the administration of an effective amount of a compounds of formula (I) described above.

Likewise an object of the invention are compounds of formula (I) described above for the treatment and prophylaxis of neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis, kidney failure as well as
5 infections caused by viruses, bacteria or fungi.

The conversion of a compound of formula (I) into a pharmaceutical usable salt can be carried by treating such a compound with an inorganic acid, for example a hydrohalic acid, such as, for example, hydrochloric acid or hydrobromic acid, sulphuric acid, nitric
10 acid, phosphoric acid etc., or with an organic acid, such as, for example, acetic acid, citric acid, maleic acid, fumaric acid, tartaric acid, methanesulphonic acid or p-toluenesulphonic acid.

The corresponding carboxylate salts of the compounds of formula (I) can also be
15 manufactured by treatment with physiologically compatible bases.

The conversion of a compound of formula (I) into a pharmaceutically usable ester can be carried out by treating such a compound in the usual manner or as described in the Examples.
20

As mentioned previously, the compounds of formula I and their pharmaceutically usable salts and esters inhibit especially the binding of various adhesive proteins such as fibrinogen, vitronectin, von Willebrand factor, fibronectin, thrombospondin and osteopontin to the vitronectin receptors (such as e.g. $\alpha v\beta 3$, $\alpha v\beta 5$, $\alpha v\beta 6$, $\alpha v\beta 8$, etc.) on the
25 surface of various types of cell. The said compounds therefore influence cell-cell and cell-matrix interactions. Since the vitronectin receptors play a rôle, inter alia, in the spread of tumour cells, in the new growth of vascular tissue, in the degradation of bone tissue, in the migration of smooth muscle cells in vascular walls and in the penetration of virus particles into target cells, the said compounds can be used as vitronectin receptor antagonists in the
30 control or prevention of neoplasms, tumor metastasizing, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, kidney failure as well as infections caused by viruses, bacteria or fungi. Since the binding of adhesive proteins to the fibrinogen receptor ($\alpha IIb\beta 3$) on the surface of blood platelets is practically not inhibited, undesired side effects such as e.g. bleeding
35 can be suppressed with the therapeutic application of the said compounds.

The inhibition of the binding of adhesive proteins such as e.g. fibrinogen to vitronectin receptors (such as e.g. $\alpha_v\beta_3$, $\alpha_v\beta_5$, $\alpha_v\beta_6$, $\alpha_v\beta_8$, etc. or to the fibrinogen receptor ($\alpha_{IIb}\beta_3$) by compounds of formula (I) can be determined as described by L. Alig et al. (J.Med.Chem. 1992, 35, 4393-4407).

In detail thereto, the wells of microtitre plates (Nunc-Immunoplate MaxiSorp) were coated overnight at 4°C with the vitronectin receptor $\alpha_v\beta_3$ (from human placenta, 100 µl/well) in a buffer system with 150 mmol/l NaCl, 1 mmol/l CaCl₂, 1 mmol/l MgCl₂, 0.0005% Triton X-100 and 20 mmol/l Tris HCl, pH 7.4. The non-specific binding sites were blocked by incubation with 3.5% bovine serum albumin (BSA from Fluka) at 20°C for at least 1 h. Before the beginning of the test the plates were washed in each case once with 150 mmol/l NaCl, 1 mmol/l CaCl₂, 1 mmol/l MgCl₂ and 20 mmol/l Tris HCl, pH 7.4 (buffer A). The thus-coated plates can be stored for at least 2 months in the presence of 0.05% NaN₃ (in buffer A) at 4°C in a humidity chamber without loss of binding activity. Fibrinogen (IMCO, free from fibronectin) was diluted to 1.5 µg/ml in buffer A in the presence of 1% BSA. The wells coated with the receptor were incubated with fibrinogen (100 µl/well) overnight at room temperature in the absence of or in the presence of increasing concentrations of RGDS (as the reference substance) or the compounds to be measured. Non-bound fibrinogen was removed by three-fold washing with buffer A, bound fibrinogen was detected by an ELISA procedure. Antibodies of rabbits directed against human fibrinogen (Dakopatts, Denmark), diluted in buffer A in the presence of 0.1% BSA, were added at room temperature for 1h., followed by incubation with biotinylated antibodies directed against rabbit immunoglobulin (Amersham) for 30 min. Non-bound antibodies were removed by three-fold washing with buffer A. Thereafter, the pre-formed streptavidin-biotinylated peroxidase complex (Amersham) was added for 30 min. Three-fold washing with buffer A was again carried out. After addition of the peroxidase substrate ABTS (2,2'-azino-bis(3-ethylbenzothiazoline-6-sulphonic acid), Boehringer Mannheim) the enzyme activity was measured with a multichannel photometer (UVmax, Molecular Devices). The difference between total binding activity (in the absence of a test substance) and non-specific binding activity (in the presence of 100 µM RGDS) is taken as the specific binding activity. The concentration of a test

substance which is required to inhibit the specific binding activity by 50% was defined as the IC₅₀.

The isolation of the receptor $\alpha_v\beta_3$ used in the test can be carried out as follows:

- 5 Human placenta is stored at -80°C immediately after its excision. In order to extract the receptor, each placenta is superficially thawed and cut into narrow strips with a scalpel. The pieces are washed twice with a buffer of 150 mmol/l NaCl, 1 mmol/l CaCl₂, 1 mmol/l MgCl₂ and 20 mmol/l Tris HCl (pH 7.4). The proteins are extracted at room temperature for one hour with a buffer solution from 1% Triton X-100, 150 mmol/l NaCl, 1 mmol/l
- 10 CaCl₂, 1 mmol/l MgCl₂, 20 mmol/l Tris HCl, 0.02% NaN₃, 0.5 mmol/l phenylmethane-sulphonyl fluoride, 1 mmol/l leupeptin and 2 mmol/l N-ethylmaleimide (pH 7.4) and filtered through sterile gauze. The filtrate is centrifuged at 30000 g for 30 min. at 4°C. The glycoproteins are firstly separated with the aid of a concanavalin A-Sepharose 4B column. The proteins bound to the column are eluted and then added to a Aeg-RGDS column.
- 15 After repeated washing the bound vitronectin receptor is eluted by 3 mmol/l RGDS in a buffer of 0.1% Triton X-100, 150 mmol/l NaCl, 20 mmol/l Tris HCl, 1 mmol/l CaCl₂, 1 mmol/l MgCl₂, 0.05% NaN₃ (pH 7.0).

- The results obtained in the foregoing test using representative compounds of
- 20 formula I as the test compound are compiled in the following Table.

Table 1

<u>Substance</u>	<u>VNR</u> IC ₅₀ [nM]
(4-{{2-(3-benzyl-ureido)-thiazole-4-carbonyl}-amino}-2-methoxy-phenoxy)-acetic acid	0.2
5-{{2-(3-benzyl-ureido)-thiazole-4-carbonyl}-amino}-2-carboxymethoxy-benzoic acid	1.3
(4-((2-(3-benzyl-ureido)-thiazole-4-carbonyl)-amino)-phenoxy)-acetic acid	1.0

Preferred compounds have an IC₅₀ value which is below 100 nM; especially preferred compounds have a value below 10nM. Particularly preferred compounds have an IC₅₀ value which is below 2 nM.

5 The compounds of formula I and their pharmaceutically usable salts and esters can be used as medicaments (e.g. in the form of pharmaceutical preparations). The pharmaceutical preparations can be administered internally such as orally (e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions), nasally (e.g. in the form of nasal sprays) or rectally (e.g. in the form of
10 suppositories). The administration can, however, also be effected parentally such as intramuscularly or intravenously (e.g. in the form of injection solutions).

 The compounds of formula I and their pharmaceutically usable salts and esters can be processed with pharmaceutically inert, inorganic or organic adjuvants for the produc-
15 tion of tablets, coated tablets, dragées and hard gelatine capsules. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts etc. can be used, for example, as such adjuvants for tablets, dragées and hard gelatine capsules.

 Suitable adjuvant for soft gelatine capsules are, for example, vegetable oils, waxes,
20 fats, semi-solid substances and liquid polyols, etc.

 Suitable adjuvants for the production of solutions and syrups are, for example, water, polyols, saccharose, invert sugar, glucose, etc.

25 Suitable adjuvants for injection solutions are, for example, water, alcohols, polyols, glycerol, vegetable oils, etc.

 Suitable adjuvants for suppositories are, for example, natural or hardened oils, waxes, fats, semi-solid or liquid polyols, etc.

30

 Moreover, the pharmaceutical preparations can contain preservatives, solubilizers, viscosity-increasing substances, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain still other therapeutically valuable substances.

35

In accordance with the invention the compounds of formula I and their pharmaceutical usable salts and esters can be used as vitronectin receptor antagonists, especially for the treatment or prophylaxis of neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis, kidney failure as well as infections caused by viruses, bacteria or fungi. The dosage can vary in wide limits and will, of course be fitted to the individual requirements in each particular case. In the case of oral administration a daily dosage of about 0.1 mg to 20 mg per kg body weight, preferably about 0.5 mg to about 4 mg per kg body weight (e.g. approximately 300 mg per person), divided into preferably 1-3 individual doses, which can consist, for example, of the same amounts, should in general be adequate. It will, however, be clear that the upper limit given above can be exceeded when it is established that this is indicated.

The invention is illustrated hereinafter by Examples, which do not limit the invention.

Example 1

175 mg of 2-guanidino-4-methyl-thiazole-5-carboxylic acid, 2.6 ml of DMF,
5 0.29 ml of N-MM and 332 mg of HBTU are stirred at RT for one hour, treated with
197 mg of butyl (3-amino-propoxy)-acetate hydrochloride and stirred at RT for a further
18 hrs. For the working up, the mixture is diluted with ethyl acetate, washed with dilute
sodium carbonate solution, dilute sodium chloride solution and saturated sodium chloride
solution, dried and evaporated in a vacuum. Chromatography on silica gel with methylene
10 chloride-alcohol gives 162 mg of butyl {3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-
amino]-propoxy}-acetate, MS: 372 (M+H)⁺.

The butyl (3-amino-propoxy)-acetate hydrochloride can be prepared as follows:

- 15 a) Butyl 2-cyano-ethoxyacetate is hydrogenated on Pd/C in acetic acid and subse-
quently reacted in tert-butanol and triethylamine with di-tert-butyl dicarbonate to give
butyl (3-tert-butoxycarbonylamino-propoxy)-acetate and purified by chromatography;
MS: 290 (M+H)⁺.
- 20 b) By treatment with 4N HCl in ethyl acetate there is obtained therefrom butyl (3-
amino-propoxy)-acetate hydrochloride, m.p. 36-36°C, MS: 190 (M+H)⁺.

Example 2

25 151 mg of butyl {3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-
propoxy}-acetate are stirred for 5 hrs. in 3 ml of 25% hydrochloric acid. The reaction
mixture is evaporated to dryness in a vacuum and the residue is lyophilized from acetic
acid. There are obtained 144 mg of [3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-
amino]-propoxy]-acetic acid hydrochloride (1:1), m.p. 48-51°C, MS: 316 (M+H)⁺.

30

Example 3

400 mg of 2-guanidino-4-methyl-thiazole-5-carboxylic acid, 463 mg of ethyl 4-
amino-phenyloxyacetate hydrochloride, 6 ml of DMF, 0.67 ml of N-MM and 759 mg of
35 HBTU are stirred at RT for 22 hrs. The working up and purification are effected as

described in Example 1. Crystallization from MeCN gives 368 mg of ethyl {4-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy}-acetate, m.p. 223°C, MS: 378 (M+H)⁺.

5

Example 4

330 mg of ethyl {4-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy}-acetate are stirred at RT for 11 hrs. in 6 ml of 25% hydrochloric acid. The reaction mixture is evaporated to dryness in a vacuum and the residue is triturated in MeCN. There are obtained 293 mg of [4-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy]-acetic acid hydrochloride (1:1); m.p. 273°C, MS: 350 (M+H)⁺.

10

Example 5

2-Guanidino-4-methyl-thiazole-5-carboxylic acid is reacted with tert-butyl (3-amino-phenoxy)-acetate in the same manner as in Example 3. Chromatography on silica gel with methylene chloride-ethyl acetate and methylene chloride-alcohol gives 176 mg of tert-butyl {3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy}-acetate, m.p. 204°C, MS: 406 (M+H)⁺.

20

Example 6

142 mg of tert-butyl {3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy}-acetate is stirred in 1.1 ml of methylene chloride and 1.1 ml of TFA for 2 hrs. at RT. The reaction mixture is evaporated in a vacuum, the residue is taken up in water and the solution is evaporated to dryness. The solid is suspended in water, adjusted to pH 8 with 1N ammonia while stirring, filtered off under suction, washed with water and dried. There are obtained 101 mg of [3-[(2-guanidino-4-methyl-thiazole-5-carbonyl)-amino]-phenoxy]-acetic acid, m.p. 284°C, MS: 350 (M+H)⁺.

30

Example 7

In the same manner as described in Example 3, from 2-guanidino-thiazole-4-carboxylic acid and ethyl 4-amino-phenyloxyacetate hydrochloride there is obtained ethyl

{4-[(2-guanidino-thiazole-4-carbonyl)-amino]-phenoxy}-acetate, m.p. 206°C, MS: 364 (M+H)⁺.

Example 8

5

227 mg of ethyl {4-[(2-guanidino-thiazole-4-carbonyl)-amino]-phenoxy}-acetate are stirred for 3 days at RT in 25% hydrochloric acid. The precipitate is filtered off under suction, washed with water, triturated in methanol, filtered off under suction and dried. There are obtained 165 mg of {4-[(2-guanidino-thiazole-4-carbonyl)-amino]-phenoxy}-acetic acid hydrochloride (1:1); m.p. 278°C, MS: 336 (M+H)⁺.

10

Example 9

In the same manner as described in Example 3 and crystallization from MeOH, from 2-guanidino-thiazole-5-carboxylic acid and ethyl 4-amino-phenyloxyacetate hydrochloride there is obtained ethyl {4-[(2-guanidino-thiazole-5-carbonyl)-amino]-phenoxy}-acetate, m.p. 218°C, MS: 364 (M+H)⁺.

15

Example 10

20

239 mg of ethyl {4-[(2-guanidino-thiazole-5-carbonyl)-amino]-phenoxy}-acetate are stirred for 27 hrs. in 4.8 ml of 25% hydrochloric acid. The precipitate is filtered off under suction, washed with water and dried. There are obtained 222 mg of {4-[(2-guanidino-thiazole-5-carbonyl)-amino]-phenoxy}-acetic acid hydrochloride (1:1), m.p. 336°C, MS: 364 (M+H)⁺.

25

Example 11

419 mg of 2-(3-benzyl-ureido)-thiazole-4-carboxylic acid, 265 mg of CDMT, 4.5 ml of THF and 0.18 ml of N-MM are 4.5 hrs. at RT. After the addition of 350 mg of ethyl 4-amino-phenyloxyacetate hydrochloride and 0.18 ml of N-MM the mixture is stirred for a further 20 hrs. at RT. For the working up, the mixture is diluted with ethyl acetate and washed in succession with dilute hydrochloric acid, water, dilute sodium carbonate solution, water and saturated sodium chloride solution, dried over sodium sulphate and evaporated in a vacuum. Chromatography on silica gel with methylene

35

chloride-alcohol 99:1 and crystallization from ether gives 350 mg of ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy)-acetate, m.p. 173°C, MS: 455 (M+H)⁺.

Example 12

5

243 mg of ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy)-acetate are stirred in 4.3 ml of ethanol and 0.8 ml of 1N NaOH for 4.5 hrs. at RT. For the working up, the mixture is stirred into ethyl acetate/dilute hydrochloric acid, the organic phase is separated, washed with water and sodium chloride solution, dried over sodium sulphate dried and evaporated in a vacuum. Crystallization from ether gives 208 mg of [4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy]-acetic acid, m.p. 208°C, MS: 427 (M+H)⁺.

Example 13

15

Analogously to Example 11, from 2-(3-benzyl-ureido)-thiazole-4-carboxylic acid and ethyl (4-amino-2-methoxy-phenoxy)-acetate there is obtained ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-acetate, m.p. 197-198°C, MS: 485 (M+H)⁺.

20

Example 14

In the same manner as described in Example 12 and crystallization from acetonitrile, from ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-acetate there is obtained (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-acetic acid, m.p. 210°C, MS: 457 (M+H)⁺.

25

Example 15

30

Analogously to Example 11, from 2-(3-benzyl-ureido)-thiazole-4-carboxylic acid and ethoxycarbonylmethyl 5-amino-2-ethoxycarbonylmethoxy-benzoate there is obtained ethoxycarbonylmethyl 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-ethoxycarbonylmethoxy-benzoate, m.p. 125-127°C (from ethyl acetate), MS: 585 (M+H)⁺.

35

The starting material can be prepared as follows:

- a) 5-Benzyloxycarbonylamino-2-hydroxy-benzoic acid is reacted at reflux in acetone with ethyl bromoacetate in the presence of potassium carbonate to give ethoxycarbonylmethyl 5-benzyloxycarbonylamino-2-ethoxycarbonylmethoxy-benzoate, m.p. 77-78°C, MS: 460 (M+H)⁺.
- b) By catalytic hydrogenation on Pd/C in EtOH there is obtained therefrom ethoxycarbonylmethyl 5-amino-2-ethoxycarbonylmethoxy-benzoate, MS: 326 (M+H)⁺.

10

Example 16

378 mg of ethoxycarbonylmethyl 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-ethoxycarbonylmethoxy-benzoate, 6.5 ml of ethanol and 1.29 ml of 2N sodium hydroxide solution are stirred for 5 hrs. at RT. After the addition of 3 ml of acetic acid and 2 ml of water the mixture is warmed until a homogeneous solution is obtained. After cooling the precipitate is filtered off under suction, washed with acetic acid-water 1:1 and dried. There are obtained 290 mg of 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-carboxymethoxy-benzoic acid, m.p. 219°C, MS: 471 (M+H)⁺.

20

Example 17

2-(3-Benzyl-ureido)-thiazole-4-carboxylic acid is coupled with ethyl (E)-3-(4-amino-phenyl)-acrylate in analogy to Example 11. After chromatography on silica gel with methylene chloride-ethanol 98:2 and crystallization from ether there is obtained ethyl (E)-3-[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-acrylate, m.p. 207°C, MS: 451 (M+H)⁺.

30

Example 18

235 mg of ethyl (E)-3-[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-acrylate, 4.7 ml of ethanol and 1 ml of 2N NaOH are stirred for 6 hrs. at RT. The reaction mixture is diluted with 4.7 ml of water and adjusted to pH 2 with 2 ml of 1N hydrochloric acid. The precipitate is filtered off under suction, washed with water, triturated in ethanol, filtered off under suction and dried. There are obtained 164 mg of

(E)-3-[4-[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-acrylic acid, m.p. 264°C, MS: 423 (M+H)⁺.

Example 19

5

A solution of 1.1 g (4 mmol) of 2-(3-benzyl-ureido)-thiazole-4-carboxylic acid, 1.05 g (4 mmol) of methyl [(4-amino-phenyl)-phenyl-amino]-acetate, 1.7 g (4.4 mmol) of HTBU and 0.6 ml (6 mmol) of NMM in 50 ml of DMF is stirred at room temperature overnight. After the usual working up followed by chromatography (silica gel, dichloro-
10 methane/methanol 30:1) there are obtained 1.2 g of methyl [4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-phenyl-amino]-acetate in the form of an amorphous powder. MS: 516 (M+1).

The starting material can be prepared as follows:

a) 4-Nitro-diphenylamine (Aldrich) is reacted with methyl bromoacetate in the
15 presence of potassium carbonate in DMF at 70°C to give methyl [(4-nitro-phenyl)-phenyl-amino]-acetate (brown oil). MS: 287 (M+1).

b) By catalytic hydrogenation of methyl [(4-nitro-phenyl)-phenyl-amino]-acetate in methanol in the presence of palladium/carbon (10%) there is obtained, after filtration and removal of the solvent, methyl [(4-amino-phenyl)-phenyl-amino]-acetate in the form of a
20 brown oil. MS: 256 (M+).

Example A

A compound of formula I can be used in a manner known per se as the active ingredient for the production of tablets of the following composition:

25		<u>Per tablet</u>
	Active ingredient	200 mg
	Microcrystalline cellulose	155 mg
	Corn starch	25 mg
	Talc	25 mg
30	Hydroxypropylmethylcellulose	<u>20 mg</u>
		425 mg

Example B

A compound of formula I can be used in a manner known per se as the active
 5 ingredient for the production capsules of the following composition:

	<u>Per capsule</u>
Active ingredient	100.0 mg
Corn starch	20.0 mg
Lactose	95.0 mg
10 Talc	4.5 mg
Magnesium stearate	<u>0.5 mg</u>
	220.0 mg

Claims:

- 1) Compounds of formula (I)

wherein

R^1 is

R^2 is

R^3 is hydrogen, alkyl, cycloalkyl, aryl, aralkyl, heteroaryl, carboxy, alkyl-O-CO- or aralkyl-O-CO-;

R^4 is hydrogen, alkyl, cycloalkyl, aryl or heteroaryl;

R^5 and R^6 independently of one another are hydrogen, alkyl, cycloalkyl or heteroaryl;

R^7 and R^8 independently of one another are hydrogen, alkyl, cycloalkyl or heteroaryl or

R^7 and R^8 together with the N atoms to which they are attached form a 5- to 8-membered heterocyclic ring which can carry one or more alkyl substituents;

R^9 is hydrogen, alkyl or cycloalkyl;

R^{10} is hydrogen, aryl, aralkyl, heteroaryl, heterocyclalkyl, carboxyalkyl, alkyl, cycloalkyl, alkyl-O-CO-, aralkyl-O-CO-, alkyl-CO-, alkylsulphonyl, arylsulphonyl or heteroarylsulphonyl;

A is oxygen, sulphur, -CH=CH-

a to f are zero or whole positive integers, with a being zero to 2; b being zero to 4; c and d being zero or 1, with the proviso that c and d are not both simultaneously zero; e is zero to

5, with the proviso that e is other than zero when d is zero and e is zero to 3 when A is equal to $-\text{CH}=\text{CH}-$; and f is zero to 3, with the proviso that f is not zero when A is oxygen, sulphur or

and their pharmaceutically usable salts and esters.

- 2) Compounds in accordance with claim 1, in which R^2 is

and R^9 , A, d to f are as defined in claim 1.

- 3) Compounds in accordance with claim 1 or 2, in which R^2 is

and R^9 , A, e and f are as defined in claim 1.

- 20 4) Compounds in accordance with any one of claims 1 to 3, in which R^2 is

and R^9 , A and f are as defined in claim 1.

25

- 5) Compounds in accordance with claim 1 or 2, in which R^2 is

e is 1 to 5 and R⁹, A and f are as defined in claim 1.

5 6) Compounds in accordance with any one of claims 1 to 5, in which A is oxygen or -CH=CH-.

7) Compounds in accordance with any one of claims 1 to 6, in which R¹ is

8) Compounds in accordance with any one of claims 1 to 7, in which arylene is phenylene or substituted phenylene, with the substituted phenylene carrying one or more alkoxy, aralkoxy, halogen, alkoxy-alkoxy, carboxy or

15

substituents.

9) Compounds in accordance with claim 8, in which arylene is meta- or para-phenylene or substituted meta- or para-phenylene, with the substituents of the phenylene previously given by R² standing meta- or para- to one another and with the substituted phenylene carrying on the ring an additional substituent selected from the group of alkoxy, carboxy or

25

10) Compounds in accordance with any one of claims 1 to 9, in which R³ is hydrogen, alkyl, cycloalkyl or phenyl.

11) Compounds in accordance with any one of claims 1 to 10, in which R⁴ is
30 hydrogen, alkyl, cycloalkyl or phenyl.

12) Compounds in accordance with any one of claims 1 to 11, in which R^5 , R^6 , R^7 and R^8 are hydrogen or R^5 and R^6 are both hydrogen and R^7 and R^8 together with the N atoms to which they are attached form a 5- to 6-membered ring.

5 13) Compounds in accordance with any one of claims 1 to 12, in which R^9 is hydrogen or cycloalkyl.

14) Compounds in accordance with any one of claims 1 to 13, in which R^2 is attached to position 4 and R^3 is attached to position 5 of the thiazole ring.

10

15) Compounds in accordance with any one of claims 1 to 14, selected from:

Ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy)-acetate;
 [4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenoxy]-acetic acid;
 15 ethyl (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-acetate;
 (4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-methoxy-phenoxy)-acetic acid;
 ethoxycarbonylmethyl 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-ethoxycarbonylmethoxy-benzoate;
 20 5-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-2-carboxymethoxy-benzoic acid;
 ethyl (E)-3-[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-acrylate;
 25 (E)-3-[4-[[2-(3-benzyl-ureido)-thiazole-4-carbonyl]-amino]-phenyl]-acrylic acid.

16) A process for the manufacture of a compound of formula I, which process comprises reacting a compound of the formula

(XVIII)

30

with an amine of the formula

in which R^1 , R^3 , R^9 , a and d to f have the significance given in claim 1, c is equal to 1 and R^{11} is alkyl or aralkyl.

5

17) Compounds in accordance with any one of claims 1 to 15 for use as therapeutically active substances.

18) Compounds in accordance with any one of claims 1 to 15 for the
10 production of medicaments for the prophylaxis and treatment of illnesses which are based on a malfunction of the binding of adhesive proteins to vitronectin receptors.

19) A pharmaceutical preparation containing a compound in accordance with any one of claims 1 to 15 and a therapeutically inert carrier.

15

20) A pharmaceutical preparation in accordance with claim 19, which additionally contains one or more compounds which are selected from the group consisting of anticoagulants, fibrinolytics, compounds in accordance with claim 1 as well as medicaments for the prophylaxis and therapy of illnesses which are based on a
20 malfunction of the binding of adhesive proteins to vitronectin receptors.

21) The use of compounds in accordance with any one of claims 1 to 15 for the production of medicaments.

22) The use of compounds in accordance with any one of claims 1 to 15 for the
25 production of medicaments for the treatment and prophylaxis of neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis, kidney failure as well as infections caused by viruses, bacteria or fungi and, respectively,
30 for the production of corresponding medicaments.

23) Compounds in accordance with any one of claims 1 to 15, when manufactured according to the process set forth in claim 16.

24) A method for the treatment and prophylaxis of illnesses which are based on a malfunction of the binding of adhesive proteins to vitronectin receptors, whereby an effective amount of a compound in accordance with any one of claims 1 to 15 is
5 administered.

25) A method for the treatment and prophylaxis of neoplasms, tumour metastasizing, tumour growth, osteoporosis, Paget's disease, diabetic retinopathy, macular degeneration, restenosis following vascular intervention, psoriasis, arthritis, fibrosis,
10 kidney failure as well as infections caused by viruses, bacteria or fungi, which method comprises the administration of an effective amount of a compound in accordance with any one of claims 1 to 15.

26) The invention as hereinbefore described.
