SNAP AND LIFT PACKAGE FOR CONTACT LENS

Abstract

A contact lens package includes a first housing member (12) and a second housing member (14) pivotably connected to each other. The package also includes a holding mechanism (54) for holding a contact lens and a receiving mechanism (34) for receiving contact lens solution. When the housing members are in a substantially co-planar orientation, the holding mechanism is positioned within the receiving mechanism. When the housing members are in a non-planar orientation, the holding mechanism is removed from the receiving mechanism such that the holding mechanism is pivotable from a closed position, in which the contact lens held in the holding mechanism is inaccessible to a user, toward an open position, in which the contact lens held in the holding mechanism is accessible to the user.
