

ABSTRACT

5 Provided is a breast pump that includes: a container, which includes a deformable body and a lid, and further includes an inlet and a vent, where the vent is provided with a vent valve configured to allow air flow out of the container through the vent but not into the container through the vent; a nipple engaging means configured for receiving milk expressed from a user's breast; and a flexible conduit fluidly connecting the nipple engaging means with the inlet of the deformable container. During use, milk expressed from the breast flows from the nipple engaging means through the flexible conduit to the container.
