CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the benefit of U.S. Provisional Application No. 61/905,802 entitled "COMPOUNDS AND USES THEREOF FOR THE MODULATION OF HEMOGLOBIN" filed November 18, 2013; and U.S. Patent Application No. 13/815,776 entitled "COMPOUNDS AND USES THEREOF FOR THE MODULATION OF HEMOGLOBIN" filed March 15, 2013, and assigned to the assignee hereof and hereby expressly incorporated by reference herein.

FIELD OF THE INVENTION

[0002] This invention provides compounds and pharmaceutical compositions suitable as allosteric modulators of hemoglobin, methods and intermediates for their preparation, and methods for their use in treating disorders mediated by hemoglobin and disorders that would benefit from tissue and/or cellular oxygenation.

STATE OF THE ART

[0003] Sickle cell disease is a disorder of the red blood cells, found particularly among those of African and Mediterranean descent. The basis for sickle cell disease is found in sickle hemoglobin (HbS), which contains a point mutation relative to the prevalent peptide sequence of hemoglobin (Hb).

[0004] Hemoglobin (Hb) transports oxygen molecules from the lungs to various tissues and organs throughout the body. Hemoglobin binds and releases oxygen through conformational changes. Sickle hemoglobin (HbS) contains a point mutation where glutamic acid is replaced with valine, allowing HbS to become susceptible to polymerization to give the HbS containing red blood cells their characteristic sickle shape. The sickled cells are also more rigid than normal red blood cells, and their lack of flexibility can lead to blockage of blood vessels. US 7, 160,910 discloses compounds that are allosteric modulators of hemoglobin. However, a need exists for additional therapeutics that can treat disorders that are mediated by Hb or by abnormal Hb such as HbS.

 e is an integer of from 1 to 4.

[0058] In some less preferred embodiments R^{34} and R^{35} can be hydrogen.

[0059] In one embodiment, the subscript e is preferably 2 and each R^{32} and R^{33} is preferably independently selected from the group, H, CH_3 , and a member in which R^{32} and R^{33} are joined together to form a cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, or 1,1-dioxo-hexahydro- Δ^6 -thiopyran-4-yl or tetrahydropyran-4-yl group.

[0060] With regard to the prodrug group, preferred embodiments are compounds wherein $NR^{34}R^{35}$ is morpholino.

[0061] In one embodiment, R is:

wherein

each R^{32} and R^{33} is independently H, C_1 - C_8 alkyl, or optionally, if both present on the same substituent, may be joined together to form a C_3 - C_8 cycloalkyl, C_6 - C_{10} aryl, C_3 - C_9 heterocyclyl or C_3 - C_9 heteroaryl ring system.

[0062] Within this embodiment, each R^{32} and R^{33} is independently, H, CH_3 , or are joined together to form a cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, 1,1-dioxo-hexahydro- Δ^6 -thiopyran-4-yl or tetrahydropyran-4-yl group.

[0063] In a preferred embodiment, linkage of the prodrug moiety to the rest of the active molecule is stable enough so that the serum half life of the prodrug is from about 8 to about 24 hours.

[0064] In an embodiment of the invention, the prodrug moiety comprises a tertiary amine having a pK_a near the physiological pH of 7.5. Any amines having a pK_a within 1 unit of 7.5 are suitable alternatives amines for this purpose. The amine may be provided by the amine of a morpholino group. This pK_a range of 6.5 to 8.5 allows for significant concentrations of the basic neutral amine to be present in the mildly alkaline small intestine. The basic, neutral form of the amine prodrug is lipophilic and is absorbed through the wall of the small

intestine into the blood. Following absorption into the bloodstream, the prodrug moiety is cleaved by esterases which are naturally present in the serum to release an active compound.

General Synthetic Schemes

Scheme 1

[0104] Compounds of structure **34** can be synthesized via general synthetic scheme 1.

Reduction of carboxylic acid derivative **31** gives hydroxymethyl analog **32**, which can be N-derivatized at via copper-mediated N-arylation reaction (CuI , $Ar-I$, base such as N,N -dimethylethylenediamine and potassium phosphate, heat) to give key hydroxymethyl intermediate **32**. Coupling of **32** with phenol aldehyde **33** produces the desired aldehyde analog **34** via typical Mitsunobu conditions using either triphenylphosphine or polymer supported triphenylphosphine.

[0105] General method step 1 – reduction of carboxylic acid derivative 1 to methyl

alcohol 2: To a suspension of carboxylic acid **1** (1-10mmol) in MeOH or EtOH (2-10 mL) at 0 °C was added $SOCl_2$ (1.5eq). After stirred at room temperature for 1-12h, it was concentrated to remove all solvents, dried under high vacuum to give corresponding methyl or ethyl ester. The ester was dissolved in MeOH or EtOH (5-30 mL), to this solution, was added $NaBH_4$ (1-4eq) at 0 °C, the mixture was warmed up to room temperature and stirred for additional 1-24 h. The mixture was quenched with Sat. NH_4Cl , filtered off the insolubles and the filtrate was concentrated to give crude product, which was purified by flash silica gel chromatography to give the corresponding hydroxymethylene compound **32**.

[0106] **General method step 2 – N-alkylation (1a to 1b):** The carboxylate **31a** ($R_1=H$) can be first alkylated and then reduced to give N-alkyl hydroxymethylene analog **31b** ($R_1=alkyl$).

In a typical procedure, the carboxylate **31a** (1-10mmol) is first dissolved in DMF (2-20 mL); to this was then added a base such as NaH or Cs₂CO₃ (1-1.2eq), followed by the addition of alkyl halide (eg, BnBr) (0.9-1.5eq). The reaction allowed to proceed at room temperature or heat at 40 to 115 °C for 0.5 to 24 h. In workup A, water was added to the reaction mixture, the precipitated product was collected, washed with water, and then subjected to preparative HPLC or flash silica gel chromatography purification. In workup B (for products that did not precipitate), diluted HCl or aqueous NH₄Cl was added at 0 °C to adjusted the pH to ~7, the reaction mixture was partitioned between ethyl acetate or dichloromethane and aqueous sodium chloride and the organic layer separated, dried, and solvent removed under vacuum to afford crude product which was purified by automated silica gel column chromatography, reaction appropriate solvents mixture (e.g., ethyl acetate/hexanes).

[0107] General method step 3 – Copper-mediated N-arylation from 32a to 32c: For cyclic amines (X=H, H), to a solution of hydroxymethylene compound **32a** (1-10 mmol) and aryl/hetero iodide (1-1.5eq) in iPrOH (0.5-10 mL) was added ethylene diol (1.3eq) and CuI (6.7mol%), followed by K₃PO₄ (1.3eq), then it was degassed and heated at 88 °C for 6-24 h. Alternatively, for lactams (X=O), to a solution of hydroxymethylene compound **32a** (1-10mmol) and aryl/hetero iodide (1-1.5eq) in Dioxane (2-20 mL) was added CuI (0.17eq), N,N-dimethylethylenediamine (0.17eq), K₃PO₄ (1.7eq), then it was degassed and heated at 100 °C for 6-48 h.

[0108] Workup for both procedures: the reaction mixture was cooled to room temperature the mixture was diluted with EtOAc and water, organic layer was separated and the aqueous layer was extracted with EtOAc, organic layer was combined, washed with brine, dried and concentrated to give crude product, which was purified by flash silica gel chromatography to give N-aryl/heteroaryl compound **32c**.

[0109] General method C –Mitsunobu conditions A hydroxyl (hetero)arylaldehyde derivatives (**34**) (0.1-2 mmol) mixture with substituted methylene alcohol (**33**) (0.8 to 1.2eq) and (polymer-supported) PPh₃ (1-1.5eq) in anhydrous THF (1-10mL) was stirred under nitrogen until complete dissolution. The solution was cooled to 0 °C on ice bath and DIAD or DEAD (1.1 eq) in THF or toluene was added dropwise over a 1-20 min period. The ice cooling bath was allowed to expire over 90 min and the mixture was stirred at RT for 2-48 hours. The mixture was filtered through a pad of silica. The silica was washed with ethyl acetate 2-

20mL. The combined filtrates were evaporated and the residue was dried on highvac. The residue was purified by preparative HPLC or flash silica gel chromatography.

[0110] General method A for preparing aryloxy ether analogs (4a) from substituted methylene alcohol (1) and hydroxyl aryl aldehyde derivatives (3a). A hydroxyl (hetero)arylaldehyde derivatives (3a) (0.1-2 mmol) mixture with substituted methylene alcohol (1) (0.8 to 1.2eq) and PPh_3 (1-1.5eq) in anhydrous THF (1-10mL) was stirred under nitrogen until complete dissolution. The solution was cooled to 0 °C on ice bath and DIAD or DEAD (1.1 eq) in THF or toluene was added dropwise over a 1-20 min period. The ice cooling bath was allowed to expire over 90 min and the mixture was stirred at RT for 2-48 hours. The mixture was stirred for 10 min, then filtered through a pad of silica. The silica was washed with ethyl acetate 2-20mL. The combined filtrates were evaporated and the residue was dried on highvac. The residue was purified by preparative HPLC or flash silica gel chromatography.

[0111] General method B for preparing aryloxyether analogs (4a) from substituted methylene halide (2) and hydroxyl aryl aldehyde derivatives (3a). A mixture of hydroxyl (hetero)arylaldehyde derivatives (3a) (0.1-2 mmol, 1-4 eq.), substituted methylene chloride or bromide (2) (1eq), and K_2CO_3 (2-5 eq.) (catalytic amount of NaI or Bu_4NI may also be

added) in DMF or acetonitrile (1 to 10 mL) was stirred at RT or heating up to 120 °C for 0.5-8 h under nitrogen atmosphere. In workup A, water was added to the reaction mixture, the precipitated product was collected, washed with water, and then subjected to preparative HPLC or flash silica gel chromatography purification. In workup B (for products that did not precipitate), diluted HCl or aqueous NH₄Cl was added at 0 °C to adjusted the pH to ~7, the reaction mixture was partitioned between ethyl acetate or dichloromethane and aqueous sodium chloride and the organic layer separated, dried, and solvent removed under vacuum to afford crude product which was purified by automated silica gel column chromatography using appropriate solvents mixture (e.g., ethyl acetate/hexanes).

[0112] General method C for preparing substituted methylene chloride (2a). To a solution of substituted methylene alcohol (**1**) (0.1 to 2 mmol) in DCM (1-10 mL) was added SOCl₂ dropwise (2eq to 5eq) at 0 °C or RT. The reaction mixture was stirred at RT for 10min to 6 h, or until reaction is judged complete (LC/MS). The reaction mixture is concentrated to dryness over a rotavap. The crude chloride residue was suspended in toluene, sonicated and concentrated to dryness. The process was repeated three times and dried under vacuum to give the substituted methylene chloride (**2**), usually as an off-white solid, which was used for next step without further purification. Alternatively, a solution of aqueous 1N Na₂CO₃ is then added to produce a solution of pH~ 8. the mixture was extracted with DCM (3 x10-50mL), dried over sodium sulfate, and concentrated to the crude substituted methylene chloride (**2a**), which is then purified by column chromatography on silica gel (0-100% ethyl acetate-hexanes).

[0113] General method D for preparing substituted methylene bromide (2b). To a solution of substituted methylene alcohol (**1**) (0.1 to 2 mmol) in DCM (1-10 mL) was added Ph₃P Br₂ dropwise (2eq to 5eq) at 0 °C or RT. The reaction mixture was stirred at RT for 10 min to 2 h, or until reaction is judged complete (LC/MS). The reaction mixture is concentrated to dryness over a rotavap. The residue purified by column chromatography on silica gel (0-100% ethyl acetate-hexanes) to afford the pure bromide **2b**.

[0114] General method E for preparing heterocyclic methylene derivatives 9, 10, 12 and 13. Condensation of heterocyclic ketone analog **5** with chloroformate or dialkyl carbonate gives (hetero)cyclic beta-ketone ester **6** (Step 1). The ketone ester **6** is converted to the triflate intermediate **7** by treating with a triflating agent (e.g, triflic anhydride) in the presence of an organic base such as Hunig's base (Step 2). Suzuki coupling of the triflate **7** with a boronic acid or ester affords heterocyclohexene carboxylate **8** (Step 3). Subsequent reduction of the ester group by LAH or DIBAL gives the corresponding alcohol **9-OH** (Step 4). Further reaction of the alcohol **9-OH** with thionyl chloride, Ph_3PBr_2 (or $\text{CBr}_4\text{-Ph}_3\text{P}$ or PBr_3), or alkyl/aryl sulfonyl chloride produces the corresponding **10-X** chloride, bromide or sulfonate (Step 5).

[0115] Alternatively, the double bond of heterocyclohexene carboxylate **8** is reduced to give the *cis*-heterocyclohexane **11-cis** carboxylate under palladium catalyzed hydrogenation conditions (Step 6). Reduction of the ester group of **11-cis** by LAH or DIBAL yields *cis*-alcohol

12-OH-cis (Step 8). Conversion of the alcohol **12-OH-cis** to its chloride, bromide or sulfonate (such as mesylate, tosylate) **13-X-cis** can be achieved by reacting with thionyl chloride, or Ph_3PBr_2 , or sulfonyl chloride (such as mesyl chloride or tosyl chloride) (Step 9). The *cis*-cyclohexane carboxylate **11-cis** can also be isomerized to the thermodynamically more stable *trans*-isomer **11-trans** by the treatment with an alcoholic alkoxide (e.g., ethoxide) solution. Analogously, transformation of **11-trans** ester to **12-trans** alcohol and **13-X-trans** halide is accomplished by applying conditions of Step 8 and Step 9 similar to these for the corresponding *cis*-isomers.

[0116] Coupling of the (hetero)cyclic methylene derivatives **9**, **10**, **12** and **13** with hydroxyl (hetero)arylaldehyde derivatives (**3a/3b**) by general method A or B affords the corresponding aryloxy/heteroarylether analogs (**4c** and **4d**).

[0117] General method F Scheme 2 for preparing heterocyclic methylene derivatives 18, 19, 20 and 21. The ketone ester **14** is converted to the triflate intermediate **15** by treating with a triflating agent (e.g, triflic anhydride) in the presence of an organic base such as Hunig's base (Step 1). Suzuki coupling of the triflate **15** with a boronic acid or ester affords heterocyclo carboxylate **16** (Step 2). Subsequent reduction of the ester group by LAH or DIBAL gives the corresponding alcohol **18** (Step 3). Further reaction of the alcohol **18** with thionyl chloride, Ph_3PBr_2 (or $\text{CBr}_4\text{-Ph}_3\text{P}$ or PBr_3), or alkyl/aryl sulfonyl chloride produces the corresponding **19** chloride, bromide or sulfonate (Step 4).

[0118] Alternatively, the double bond of **16** is reduced to give the saturated heterocyclic analog **17** under palladium catalyzed hydrogenation conditions (Step 5). Reduction of the ester group of **17** by LAH or DIBAL yields alcohol **20** (Step 7). Conversion of the alcohol **20** to its chloride, bromide or sulfonate (such as mesylate, tosylate) **21** can be achieved by reacting with thionyl chloride, or Ph_3PBr_2 , or sulfonyl chloride (such as mesyl chloride or tosyl chloride) (Step 8).

[0119] Coupling of the (hetero)cyclic methylene derivatives **18**, **19**, **20** and **21** with hydroxyl (hetero)arylaldehyde derivatives (**3a/3b**) by general method A or B affords the corresponding aryloxy/heteroaryloxyether analogs (**4e** and **4f**).

[0120] Chiral pyrrolidine methylene derivatives **25** and **26** can be prepared according to reaction sequence depicted herein. The pyrrolidine ester **24** is produced via a 1,3-dipolar cycloaddition of alkene **22** with azomethine-ylide generated in situ from formaldehyde and amino acid **23** alkene (Step1). Subsequent reduction of the ester to alcohol **25** and further conversion **26** are accomplished by analogous methods described herein. If a chiral auxiliary group such as chiral oxazolidinone derivative **22a** is used, optically active pyrrolidine derivatives **25** and **26** can also be obtained. Coupling of **25** and **26** with hydroxyl (hetero)arylaldehyde derivatives (**3a/3b**) by general method A or B affords the corresponding aryloxy/heteroaryloxyether analogs (**4**).

[0121] Separate from the general synthesis of tetrahydrothiophenes (i.e., **20** and **21**, A⁵=S) described herein, also described is a different synthetic approach to this class of analogs.

[0122] Other heterocyclic analogs (compound **5**) with C-N linkage are synthesized by applying Buchwald/Hartwig amination conditions. Many of the cyclic amines (**1**) are available commercially (e.g., **1a**, **1b**, **1c**, **1d**, and **1e**).

[0123] Protected amides of formula $-CONHR^{95}$ and $-CONHOR^{95}$ can be converted e.g., hydrolyzed to the corresponding amides according to methods known to the skilled artisan.

Prodrug Synthesis

[0124] Syntheses of the ester prodrugs start with the free carboxylic acid bearing the tertiary amine. The free acid is activated for ester formation in an aprotic solvent and then reacted with a free alcohol group in the presence of an inert base, such as triethyl amine, to provide the ester prodrug. Activating conditions for the carboxylic acid include forming the acid chloride using oxalyl chloride or thionyl chloride in an aprotic solvent, optionally with a catalytic amount of dimethyl formamide, followed by evaporation. Examples of aprotic solvents, include, but are not limited to methylene chloride, tetrahydrofuran, and the like. Alternatively, activations can be performed in situ by using reagents such as BOP

(benzotriazol-1-yloxytris(dimethylamino) phosphonium hexafluorophosphate, and the like (see Nagy et al., 1993, Proc. Natl. Acad. Sci. USA 90:6373-6376) followed by reaction with the free alcohol. Isolation of the ester products can be affected by extraction with an organic solvent, such as ethyl acetate or methylene chloride, against a mildly acidic aqueous solution; followed by base treatment of the acidic aqueous phase so as to render it basic; followed by extraction with an organic solvent, for example ethyl acetate or methylene chloride; evaporation of the organic solvent layer; and recrystallization from a solvent, such as ethanol. Optionally, the solvent can be acidified with an acid, such as HCl or acetic acid to provide a pharmaceutically acceptable salt thereof. Alternatively the crude reaction can be passed over an ion exchange column bearing sulfonic acid groups in the protonated form, washed with deionized water, and eluted with aqueous ammonia; followed by evaporation.

[0125] Suitable free acids bearing the tertiary amine are commercially available, such as 2-(N-morpholino)-propionic acid, N,N- dimethyl-beta-alanine, and the like. Non- commercial acids can be synthesized in straightforward manner via standard literature procedures.

[0126] Carbonate and carbamate prodrugs can be prepared in an analogous way. For example, amino alcohols and diamines can be activated using activating agents such as phosgene or carbonyl diimidazole, to provide an activated carbonates, which in turn can react with the alcohol and/or the phenolic hydroxy group on the compounds utilized herein to provide carbonate and carbamate prodrugs.

[0187] GBT966- 2-hydroxy-6-((4-(1-isopropyl-1H-pyrazol-5-yl)-5,6-dihydro-2H-pyran-3-yl)methoxy)benzaldehyde. The compound was synthesized in five steps starting from oxan-4-one.

[0188] **Step 1:** Into a 250-mL round-bottom flask, was placed a solution of oxan-4-one (5.0 g, 49.94 mmol, 1.00 equiv) in tetrahydrofuran (60 mL). This was followed by the addition of LDA (newly prepared from diisopropylamine and BuLi) (1.20 equiv) dropwise with stirring at -78°C . The mixture was stirred for 1 h at 0°C . HMPA (9.8 g, 54.69 mmol, 1.10 equiv) was then added to the reaction dropwise at -78°C . The mixture was stirred for another 15 min at the same temperature. 2-Ethoxy-2-oxoacetonitrile (5 g, 50.46 mmol, 1.01 equiv) was then added to the reaction dropwise at -78°C . The resulting solution was stirred for 2 h at 0°C , and then it was quenched with 50 mL of water. The resulting mixture was concentrated under vacuum, and then it was extracted with EA (50 mL x 3). The combined organic layers were washed with 2x80 mL of water and 1x80 mL of brine, dried over anhydrous sodium sulfate and concentrated under vacuum. The residue was applied onto a silica gel column with ethyl acetate/petroleum ether (1:30) as eluent to yield 1.82 g (21%) of ethyl 4-oxoxane-3-carboxylate as a colorless oil.

[0189] Step 2: Into a 50-mL round-bottom flask, was placed a solution of ethyl 4-hydroxy-5,6-dihydro-2H-pyran-3-carboxylate (570 mg, 3.31 mmol, 1.00 equiv) and DIEA (2.5 mL, 5.00 equiv) in dichloromethane (20 mL). Ti_2O (1.0 mL, 2.00 equiv) was added to the reaction dropwise at 0 °C. The resulting solution was stirred for 1 h at 0 °C and for another 2 h at room temperature. The reaction was then quenched by the addition of 20 mL of water. The resulting solution was extracted with 2x40 mL of ethyl acetate, and the combined organic layers were washed with 3x20 mL of water and 1x20 mL of brine, dried over anhydrous sodium sulfate and concentrated under vacuum. The residue was applied onto a silica gel column with ethyl acetate/petroleum ether (1:25) as eluent to yield 0.67 g (67%) of ethyl 4-[(trifluoromethane)sulfonyloxy]-5,6-dihydro-2H-pyran-3-carboxylate as a light yellow oil.

[0190] Step 3: Into a 50-mL round-bottom flask, was placed a solution of ethyl 4-[(trifluoromethane)sulfonyloxy]-5,6-dihydro-2H-pyran-3-carboxylate (540 mg, 1.77 mmol, 1.00 equiv), 1-(propan-2-yl)-5-(tetramethyl-1,3,2-dioxaborolan-2-yl)-1H-pyrazole (543 mg, 2.30 mmol, 1.30 equiv) in a solvent mixture of toluene (15.0 mL), aqueous solution of sodium carbonate (2M) (5.0 mL) and ethanol (5.0 mL). This was followed by the addition of $\text{Pd(dppf)Cl}_2\text{CH}_2\text{Cl}_2$ (115 mg, 0.08 equiv). The resulting solution was stirred for 4 h at 100 °C under N_2 . The reaction was then quenched with 15 mL of water. The resulting solution was extracted with 3x30 mL of ethyl acetate. The combined organic layers were washed with 2x50 mL of water and 1x50 mL of brine. The mixture was dried over anhydrous sodium sulfate and concentrated under vacuum. The residue was applied onto a silica gel column with ethyl acetate/petroleum ether (1:15-1:6) as eluent to yield 372 mg (79%) of ethyl 4-[1-(propan-2-yl)-1H-pyrazol-5-yl]-5,6-dihydro-2H-pyran-3-carboxylate as a light yellow oil.

[0191] Step 4: Into a 50-mL round-bottom flask, was placed a solution of ethyl 4-[1-(propan-2-yl)-1H-pyrazol-5-yl]-5,6-dihydro-2H-pyran-3-carboxylate (234 mg, 0.89 mmol, 1.00 equiv) in tetrahydrofuran (15 mL). This was followed by the addition of LAH (51 mg, 1.34 mmol, 1.52 equiv) at 0 °C. The resulting solution was stirred for 1 h at 0 °C. The reaction was then quenched by the addition of 10 mL of 2.5 M sodium hydroxide aq. The resulting solution was extracted with 3x30 mL of ethyl acetate and the organic layers combined. The resulting mixture was washed with 1x20 mL of water and 1x20 mL of brine. The mixture was dried over anhydrous sodium sulfate and concentrated under vacuum. furnish 124 mg (63%) of [4-[1-(propan-2-yl)-1H-pyrazol-5-yl]-5,6-dihydro-2H-pyran-3-yl]methanol as a colorless oil.

[0192] Step 5: Into a 25-mL round-bottom flask, was placed a solution of [4-[1-(propan-2-yl)-1H-pyrazol-5-yl]-5,6-dihydro-2H-pyran-3-yl]methanol (124 mg, 0.56 mmol, 1.00 equiv), 2,6-dihydroxybenzaldehyde (116 mg, 0.84 mmol, 1.50 equiv), and PPh₃ (220 mg, 0.84 mmol, 1.50 equiv), in tetrahydrofuran (10 mL). This was followed by the addition of DIAD (170 mg, 0.84 mmol, 1.50 equiv) dropwise with stirring at 0 °C. The resulting solution was stirred for 30 min at 0 °C and for an additional 1 h at room temperature. The reaction was then quenched by the addition of 10 mL of water. The resulting solution was extracted with 3x25 mL of ethyl acetate and the organic layers combined. The resulting mixture was washed with 2x60 mL of water and 1x40 mL of brine. The mixture was dried over anhydrous sodium sulfate and concentrated under vacuum. The residue was applied onto a silica gel column with ethyl acetate/petroleum ether (1:10-1:7) as eluent. The crude product was further purified by Prep-HPLC with the following conditions (Prep-HPLC-010): Column, SunFire Prep C18 OBD Column, 5µm, 19*150mm,; mobile phase, water with 0.05%TFA and MeCN (42.0% MeCN up to 55.0% in 8 min, up to 95.0% in 2 min, down to 42.0% in 2 min); Detector, Waters2545 UvDetector 254&220nm. After stirred for 20 min, it was quenched with Sat. NH₄Cl, the mixture was extracted with EtOAc (3X), organic layers were combined, dried over

MgSO₄ and was concentrated to give tert-butyl 3-(hydroxymethyl)-4-(1-isopropyl-1H-pyrazol-5-yl)-2,5-dihydro-1H-pyrrole-1-carboxylate as crude product, which was used without purification in next step.
