Device for the Metered Delivery of a Viscous Liquid

Abstract

A device for the metered delivery of a viscous liquid has a body (30) with a continuous drill hole (31) in which two pistons (38, 39) are moved back and forth, whereby the distance between the faces is varied. In this way, the pistons transport a specific volume of liquid from a first chamber (42) to a second chamber (43).

The device is suitable for mounting onto the writing head (26; 53) of an apparatus for the application of adhesive to a substrate.
