

Description

The present invention relates to a safety gear e.g. for an elevator car or counterweight, said safety gear comprising at least one wedge chamber and at least one working wedge acting upon a guide rail of the elevator and activated by means of a transmission element.

In elevators having a rated car speed exceeding 1 m/s, sliding safety gears are normally used as precautions when the elevator speed for some reason increases too much. The sliding safety gears grip the guide rails, of which there are usually two or four. In cases where each guide rail has its own sliding safety gear, the safety gears are mutually synchronized via separate synchronizing levers. The sliding safety gear is provided with a sliding surface which has a high friction coefficient and is pressed against the guide rail when the safety gear is activated, thus decelerating or stopping the elevator car by means of friction.

Various elevator safety gear structures have been developed. One of the commonest is a large U-shaped spring made of spring steel, in which a wedge is thrust into the gap between the spring ends as it grips the guide rail. In addition, many safety gears have a separate release wedge by means of which the wedge is released from the guide rail after the safety gear action. The releasing is effected by raising the elevator car.

An example of the state of the art is also Finnish patent no. 74686, corresponding to German patent DE 3715098 and American patent US 4819765. To stop the elevator car unit, both the car unit and the counterweight can be provided with safety gears e.g. as presented in FI patent 74686 and, to ensure safe operation in door zones, the overspeed governor can be provided with an electrically operated triggering device for switch-over to low speed. However, this is an expensive solution and takes up plenty of room because a safety gear is needed for the counterweight as well. In a sliding elevator safety gear according to this patent, standard parts are used and the wedge chamber is provided with a power means which imparts to the counter wedge a force acting substantially in the direction of the guide surface. The distance between the upper edges of the guide surfaces is equal to or greater than the distance between the lower edges of the corresponding guide surfaces. The force of the power means is generated by a spring. This patent does not accomplish compensation of the changes of friction on both sides but only on the side of the spring. Moreover, the clearances are relatively small.

In certain countries, the elevator regulations have been revised to prevent the occurrence of the following accidents:

- An elevator car hits the ceiling of the elevator shaft after running up at an overspeed.
- A passenger is crushed by the doorway structures of an elevator that has left a floor with doors open.

The new regulations also allow more freedom for the design of the safety equipment as they permit the use of non-mechanical solutions as well.

The double-sided safety gear of the invention is an improvement to the currently used safety gear, which was described above as an example of the state of the art. The object of the present invention is to eliminate the drawbacks mentioned. The safety gear of the invention has at least one biased counter wedge for each working wedge of the elevator, said counter wedge moving along a guide surface provided in the wedge chamber, and the counter wedge of the working wedge is on the same side of the guide rail as the working wedge in question.

The preferred embodiments of the invention are presented in the other claims.

The device of the invention has the advantages that

- the clearances are larger than in previously known solutions
- the variations in friction appearing on both sides of the guide rail can be eliminated, so the friction coefficient remains constant
- user safety is improved as well.

In the following, the safety gear of the invention is described in detail by referring to the drawings, in which

- Fig. 1 presents the safety gear of the invention
- Fig. 2 presents the same safety gear in top view
- Fig. 3 presents the safety gear of the invention in top view, showing a lever system, a synchronizing fork and a guide rail.

The safety gear has a frame 4 which is fixed to the elevator car unit 1 by means of bolts 2. The frame is provided with a wedge chamber 8, which houses working wedges 9 placed on either side of the guide rail 30. The upper and lower ends of the working wedges 9 differ in width because of their wedge-like shape. For each working wedge 9 there is a counter wedge 10, which also has a wedge-like shape, and these two counter wedges 10 are placed on either side of the guide rail 30. For lateral adjustment of the wedge chamber 8, the safety gear is provided with adjusting screws 7 seated in the safety gear frame 4. The working wedges 9 are attached by their upper ends with synchronizing forks 31 via levers 37 to ropes or other lifting means. This safety gear can only grip during downward travel of the elevator car. The

wedge chamber 8 is provided with guide surfaces 14 and 39, along which the counter wedge 10 moves so that the guide surfaces 14 and 39 are parallel to each other. The counter wedge 10 has a guide surface 13 provided with balls 15 on which the working wedge 9 moves. The distance of guide surface 13 from the guide rail 30 diminishes as you trace the guide surface by moving upwards along it, and, similarly, the distance of guide surface 15 from the guide rail 30 increases as you follow it in the upward direction. Correspondingly, the counter wedge 10 moves along guide surface 14. The wedge chamber 8 is centered relative to the guide rail by means of screws 7. The friction between the guide surface of the wedge chamber and the counter wedge is reduced by means of balls 15, which convert the friction into rolling friction. To hold the balls 15 in place, the guide surfaces are provided with rolling slots 16. The guide surface between wedges 9 and 10 is provided with similar rolling slots 16. To ensure that the balls will not come out of their rolling slots, the wedge chamber is provided with retaining cotters 12 placed at the lower ends of the slots. At the upper ends the corresponding retaining cotters 11 are attached to the wedges 9. Balls 15 and 42 in slots 14 and 39 keep wedges 10 at the right distance from the wedge chamber. The rolling slots 17 and the guide pins 41 keep the wedges 9 at the right distance from the surface of the counter wedge 10. The vertical surface of the wedges 9 travelling along the elevator guide rail 30 are provided with separate braking surfaces 18 with friction characteristics that are better than those of the wedge material itself. The lower part of the working wedge 9 is provided with an adjusting screw 32, whose stop face is the bottom surface 33 of the counter wedge 10. Attached to the upper ends of the working wedges 9 are synchronizing rods 34, which are further attached to the synchronizing forks 31 and the levers 37. Between the wedge chamber 8 and the upper ends of the counter wedges 10 are pressure springs 40 which push the counter wedges 10 obliquely downwards. The pressure Springs 40 are attached to the counter wedges 10 by retention screws 35. The stop faces 36 of the pressure springs 40 in the wedge chamber 8 are so inclined as to direct the spring force applied to the counter wedges 10 so that it will act in a direction parallel to guide surfaces 14 and 39. Furthermore, the wedge chamber 8 is provided with protecting plates (not shown) to prevent the wedges from moving sideways out of the wedge chamber 8. At the same time, they protect the wedge chamber 8 against dirt and rubbish.

Below is a brief description of the operation of the safety gear of the invention. When the speed of the elevator car during downward travel increases

too much, the overspeed governor (not shown in the figure) is activated, causing the working wedges 9 of the safety gear to rise. The working wedges 9 act simultaneously in the same direction. As the elevator car and, along with it, the wedge chamber 8 travel downwards in relation to the wedges 9, the braking surfaces 18 of the working wedges 9 engage the elevator guide rail 30 and the working wedges 9 continue moving upwards in relation to the wedge chamber 8. The relative upward motion of the working wedge 9 in relation to the wedge chamber 8 also causes the counter wedges 10 to move upwards against the springs 40. The upward motion of the counter wedge 10 is less than that of the working wedge 9 because the total angle β of the counter wedge 10, i.e. the angle between surfaces 13 and 14, is larger than the angle α of the working wedge 9. This angle is the angle between surface 13 and the vertical direction. The magnitude of the difference between the motions of the counter wedge 10 and the working wedge 9 depends on the angle between the guide surfaces 13 and 14. During this motion, the spring force of the spring 40 increases and also the friction between surface 18 and the guide rail 30 increases. The adjusting screw 32 hits the bottom 33 of the counter wedge 10, causing the upward motion to stop and the frictional force to remain constant. The motion stops because otherwise the counter wedge 10 would come clear of the guide surface 14, whereupon the normal force would disappear and so would the friction. The spring will then return the counter wedge 10 back against the guide surface 14. After the safety gear action, when the elevator is released by raising the car, a motion in the opposite direction occurs and the springs 40 push the wedges back into place. The safety gear is so constructed that the working wedges 9 touch the elevator guide rail 30 before the counter wedges 10 are stopped in their upper position. As the working wedges 9 rise due to friction towards the limit of their upper position, the counter wedge 10 is also pushed up due to friction against the spring force F. By virtue of the wedge action, the frictional force obtained with spring force F between the wedges and the elevator guide rail 30 is very large, allowing a high braking power to be achieved. Because of angle α , only a small spring force is needed and therefore a sufficient gripping power is achieved with a small spring. In the future, when the regulations permit, the data indicating the need for safety gear action may be obtained e.g. from a tachometer monitoring the car motion. The wedges can be moved e.g. using electromagnets.

It is obvious to a person skilled in the art that different embodiments of the invention are not restricted to the examples described above, but that

they may instead be varied within the scope of the following claims.

Claims

1. Safety gear e.g. for an elevator car or counterweight, comprising at least one wedge chamber (8) and at least one working wedge (9) acting on an elevator guide rail (30) and activated by means of a transmission element, characterized in that the safety gear has for each working wedge (9) at least one biased counter wedge (10) moving along guide surfaces (14 and 39) provided in the wedge chamber (8), and that the counter wedge (10) of the working wedge (9) is on the same side of the guide rail as the working wedge (9) in question.
2. Safety gear according to claim 1, characterized in that the angle (β) between the guide surface (14) provided in the wedge chamber (8) to guide the counter wedge (10) and the guide surface (13) on the side facing the working wedge (9) is larger than the angle (α) between the vertical direction and the working wedge surface facing the counter wedge (10), so that the upward motion of the counter wedge (10) is less than that of the working wedge (9).
3. Safety gear according to claim 1 or 2, characterized in that it has two working wedges (9), which are placed on opposite sides of the guide rail (30) and are symmetrical relative to the guide rail, and that the working wedges (9) act simultaneously and in the same direction during gripping.
4. Safety gear according to claim 1, 2 or 3, characterized in that during safety gear action the adjusting screw (32) provided in the working wedge (9) hits the narrower bottom end of the counter wedge (10).
5. Safety gear according to any one of the preceding claims, characterized in that the safety gear is provided with pressure springs (40) attached with fixing screws (35) by their one end to the wider ends of the counter wedges (10) and by the other end to stop faces (36) in the wedge chamber (8).

Patentansprüche

1. Fangvorrichtung z.B. für eine Aufzugkabine oder ein Gegengewicht, mit zumindest einer Keilkammer (8) und mindestens einem Arbeits-

keil (9), der auf eine Aufzugführungsschiene (30) wirkt und durch ein Übertragungselement aktivierbar ist,

dadurch gekennzeichnet,

daß die Fangvorrichtung für jeden Arbeitskeil (9) zumindest einen vorgespannten Gegenkeil (10) aufweist, der sich entlang von in der Keilkammer (8) ausgebildeten Führungsflächen (14,39) bewegt, und daß der Gegenkeil (10) des Arbeitskeils (9) auf der gleichen Seite der Führungsschiene wie der fragliche Arbeitskeil (9) angeordnet ist.

2. Fangvorrichtung nach Anspruch 1, dadurch gekennzeichnet, daß der Winkel (β) zwischen der in der Keilkammer (8) vorgesehenen Führungsfläche (14) zur Führung des Gegenkeils (10) und der Führungsfläche (13) auf der dem Arbeitskeil (9) zugewandten Seite größer als der Winkel (α) zwischen der Vertikalen und der Arbeitskeiloberfläche ist, die dem Gegenkeil (10) zugewandt ist, so daß die Aufwärtsbewegung des Gegenkeils (10) geringer als die des Arbeitskeils (9) ist.
3. Fangvorrichtung nach Anspruch 1 oder 2, dadurch gekennzeichnet, daß sie zwei Arbeitskeile (9) aufweist, die auf einander abgewandten Seiten der Führungsschiene (30) und symmetrisch zur Führungsschiene angeordnet sind, und daß die Arbeitskeile (9) während der Betätigung gleichzeitig und in der gleichen Richtung wirken.
4. Fangvorrichtung nach den Ansprüchen 1, 2 oder 3, dadurch gekennzeichnet, daß während der Betätigung der Fangvorrichtung eine in dem Arbeitskeil (9) vorgesehene Einstellschraube (32) das schmalere untere Ende des Gegenkeils (10) trifft.
5. Fangvorrichtung nach einem der vorhergehenden Ansprüche, dadurch gekennzeichnet, daß die Fangvorrichtung mit Druckfedern (40) versehen ist, die durch Halteschrauben (35) mit ihrem einen Ende an den breiteren Enden der Gegenkeile (10) befestigt sind und mit ihrem anderen Ende an Anschlagflächen (36) in der Keilkammer (8).

Revendications

1. Parachute de sécurité par exemple pour une cabine d'ascenseur ou un contrepoids, comprenant au moins une chambre à coins (8) et

they may instead be varied within the scope of the following claims.

Claims

1. Safety gear e.g. for an elevator car or counterweight, comprising at least one wedge chamber (8) and at least one working wedge (9) acting on an elevator guide rail (30) and activated by means of a transmission element, **characterized** in that the safety gear has for each working wedge (9) at least one biased counter wedge (10) moving along guide surfaces (14 and 39) provided in the wedge chamber (8), and that the counter wedge (10) of the working wedge (9) is on the same side of the guide rail as the working wedge (9) in question.
2. Safety gear according to claim 1, **characterized** in that the angle (β) between the guide surface (14) provided in the wedge chamber (8) to guide the counter wedge (10) and the guide surface (13) on the side facing the working wedge (9) is larger than the angle (α) between the vertical direction and the working wedge surface facing the counter wedge (10), so that the upward motion of the counter wedge (10) is less than that of the working wedge (9).
3. Safety gear according to claim 1 or 2, **characterized** in that it has two working wedges (9), which are placed on opposite sides of the guide rail (30) and are symmetrical relative to the guide rail, and that the working wedges (9) act simultaneously and in the same direction during gripping.
4. Safety gear according to claim 1, 2 or 3, **characterized** in that during safety gear action the adjusting screw (32) provided in the working wedge (9) hits the narrower bottom end of the counter wedge (10).
5. Safety gear according to any one of the preceding claims, **characterized** in that the safety gear is provided with pressure springs (40) attached with fixing screws (35) by their one end to the wider ends of the counter wedges (10) and by the other end to stop faces (36) in the wedge chamber (8).

Patentansprüche

1. Fangvorrichtung z.B. für eine Aufzugskabine oder ein Gegengewicht, mit zumindest einer Keilkammer (8) und mindestens einem Arbeits-

keil (9), der auf eine Aufzugführungsschiene (30) wirkt und durch ein Übertragungselement aktivierbar ist,

dadurch **gekennzeichnet**,

daß die Fangvorrichtung für jeden Arbeitskeil (9) zumindest einen vorgespannten Gegenkeil (10) aufweist, der sich entlang von in der Keilkammer (8) ausgebildeten Führungsflächen (14,39) bewegt, und daß der Gegenkeil (10) des Arbeitskeils (9) auf der gleichen Seite der Führungsschiene wie der fragliche Arbeitskeil (9) angeordnet ist.

2. Fangvorrichtung nach Anspruch 1,

dadurch **gekennzeichnet**,

daß der Winkel (β) zwischen der in der Keilkammer (8) vorgesehenen Führungsfläche (14) zur Führung des Gegenkeils (10) und der Führungsfläche (13) auf der dem Arbeitskeil (9) zugewandten Seite größer als der Winkel (α) zwischen der Vertikalen und der Arbeitskeiloberfläche ist, die dem Gegenkeil (10) zugewandt ist, so daß die Aufwärtsbewegung des Gegenkeils (10) geringer als die des Arbeitskeils (9) ist.

3. Fangvorrichtung nach Anspruch 1 oder 2,

dadurch **gekennzeichnet**,

daß sie zwei Arbeitskeile (9) aufweist, die auf einander abgewandten Seiten der Führungsschiene (30) und symmetrisch zur Führungsschiene angeordnet sind, und daß die Arbeitskeile (9) während der Betätigung gleichzeitig und in der gleichen Richtung wirken.

4. Fangvorrichtung nach den Ansprüchen 1, 2 oder 3,

dadurch **gekennzeichnet**,

daß während der Betätigung der Fangvorrichtung eine in dem Arbeitskeil (9) vorgesehene Einstellschraube (32) das schmalere untere Ende des Gegenkeils (10) trifft.

5. Fangvorrichtung nach einem der vorhergehenden Ansprüche,

dadurch **gekennzeichnet**,

daß die Fangvorrichtung mit Druckfedern (40) versehen ist, die durch Halteschrauben (35) mit ihrem einen Ende an den breiteren Enden der Gegenkeile (10) befestigt sind und mit ihrem anderen Ende an Anschlagflächen (36) in der Keilkammer (8).

Revendications

1. Parachute de sécurité par exemple pour une cabine d'ascenseur ou un contrepoids, comprenant au moins une chambre à coins (8) et

- au moins un coin de travail (9) agissant sur un rail de guidage (30) de l'ascenseur et activé au moyen d'un élément de construction, caractérisé en ce que le parachute de sécurité possède pour chaque coin de travail (9) au moins un coin antagoniste sollicité (10) qui se déplace le long de surfaces de guidage (14 et 39) prévues dans la chambre à coins (8), et que le coin antagoniste (10) associé au coin de travail (9) est situé du même côté du rail de guidage que le coin de travail (9) en question. 5 10
2. Parachute de sécurité selon la revendication 1, caractérisé en ce que l'angle (β) entre la surface de guidage (14) prévue dans la chambre à coins (8) pour guider le coin antagoniste (10) et la surface de guidage (13) située sur le côté tourné vers le coin de travail (1) est supérieur à l'angle (α) présent entre la direction verticale et la surface du coin de travail qui est tourné vers le coin antagoniste (10) de sorte que le déplacement ascendant du coin antagoniste (10) est inférieur à celui du coin de travail (9). 15 20 25
3. Parachute de sécurité selon la revendication 1 ou 2, caractérisé en ce qu'il comporte deux coins de travail (9), qui sont disposés sur des côtés opposés du rail de guidage (3) et sont symétriques par rapport à ce dernier, et que les coins de travail (9) agissent simultanément et dans le même sens pendant un serrage. 30
4. Parachute de sécurité selon la revendication 1, 2 ou 3, caractérisé en ce que pendant le fonctionnement du parachute de sécurité, la vis de réglage (32) prévue dans le coin de travail (9) rencontre l'extrémité inférieure plus étroite du coin antagoniste (10). 35 40
5. Parachute de sécurité selon l'une quelconque des revendications précédentes, caractérisé en ce que le parachute de sécurité est équipé de ressorts de pression (40) fixés au moyen de vis de fixation (35) par une de leurs extrémités, aux extrémités plus larges des coins antagonistes (10) et, par leur autre extrémité, à des faces de butée (36) dans la chambre à coins (8). 45 50 55
