DATA DISTRIBUTION SYSTEM AND DATA BUSINESS GATEWAY SYSTEM FOR IMPLEMENTING THE DATA DISTRIBUTION SYSTEM

FIELD OF THE INVENTION

The present invention relates to a data distribution system for properly and effectively using data owned by companies/groups in different industry sectors which are connected via a network or individuals, as a system for data trading between plural data handling systems which each transmit and receive data independently. In other words, it relates to a data distribution system which makes distribution of various types of data open in order to construct a data distribution market in which closed data exchanges within systems are made open.

In addition, the present invention relates to a data business gateway system which enables and promotes data trading (data distribution) even between independent systems. Furthermore, the present invention relates to a data distribution method which enables data trading between independent systems.

In the application filed as a prior application (Japanese Patent Application No. 2012-149943), the present inventors describe a service provision system which provides services such as business applications and information to service
