ABSTRACT

SWITCH ASSEMBLY AND ITS USE IN A FLASHLIGHT

A switch assembly, particularly for use in a flashlight, is provided which is moveable about a longitudinal axis of a flashlight between at least a first position for placing the light source in electrical continuity with the power source and a second position breaking the electrical continuity between the light source and the power source. The switch assembly is connected to the flashlight in a removable and aesthetically pleasing manner and, during operation, wiping of contact strips ensures continual prevention of corrosion build-up.
