

ABSTRACT

The disclosure provides a data sampling method and apparatus, and a storage medium. Data label sets corresponding to respective scenes are acquired; based on multiple pieces of label information corresponding to different images in the respective data label sets, the number of times for which each label information category of M label information categories corresponding to the respective data label sets appears is counted, and initial weights of the respective data label sets are determined; based on the negative correlation between the number of times for which the label information category appears and the weights, the initial weight of each scene is adjusted to obtain a sampling weight of the data label set of each scene; and sampling is performed based on the sampling weight.
