

ABSTRACT

QUALITY DETERMINATION DEVICE

5 A quality determination apparatus (13) includes a state detector and a main processing
unit (64). The state detector detects a state index. The state index is an index indicating a state
of a target article contained in a storage space (5) where an internal environment is controlled.
The main processing unit (64) performs a determination operation. The determination operation
is an operation of determining whether a sign condition indicating a sign of degradation of the
10 target article is met based on the state index detected by the state detector.
